PMI Linear Motion Systems

Ballscrews/ Precision Ball Screw Spline/ Linear Guideway/ Ball Spline/ Actuator General Catalog

COMPANY INTRODUCTION

PMI was established in 1990. It's highly involved in manufacturing of ballscrews, linear guideway and actuator, which is the critical component of precision machinery and mainly applied to Machine Tool, Electric Discharging Machine, Cutting Wire Machine, Plastics Injection Machine, Semi-conductor Equipment, Precision Orientation Equipment and other equipments and machines.

Recent years, ***PMI*** places great emphasis in upgrading not only the manufacturing and quality of products but also the manpower. In addition to comply with requirement of quality management system, ***PMI*** has been actively carried out "RoHS Green Environmental System" and environmentally friendly management system to conform to the regulation in order to reach a pollution-free workplace.

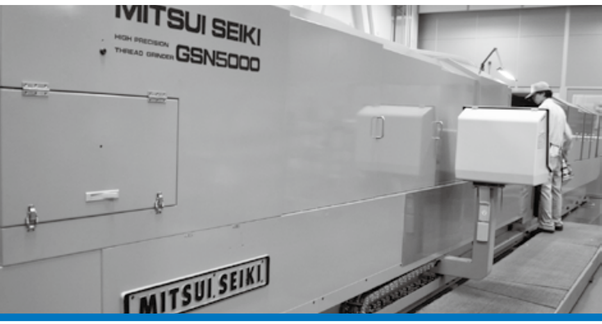
Environment Policy

PMI devotes in research & developing and manufacturing of Precision Linear Motion Components. To provide world class levels of service, quality and learning through our innovative business philosophy, that is integral to all ***PMI*** 's transmission components and services. To protect the environment and personal safety by more actively promoting and implementing the RoHS green system, ESH and energy management systems. To meet or exceed regulatory levels for emission and waste control, within a labor-friendly work environment that utilizes the latest energy reduction technology to make ***PMI*** a leader in environmental protection. Through the guidance of safety and environmental management systems, energy awareness advocacy and setting up the related regulations, we promise to prevent any pollution, conserve resources, safety as priority, enhance health and energy-saving, with every staff's involvement. In accordance with the spirits of innovations and developments, ***PMI*** can provide the best mechanical efficiency and quality service to our customers, ensure the personal safety, reduce any harmful factors to every staff in the working place, increase the knowledge of safety and environment, prevent any pollutions, injuries, diseases happened, and effective energy control. Moreover, to be a sustainable development GREEN INDUSTRY, ***PMI*** will continue to improve the safety, environment activities and energy usage management in order to take the corporation social responsibility to the utmost and reduce any harmful factors and energy consumption during the manufacturing.



We promise and are devoted to implement the following environmental and energy policies:

1. By reducing pollution and continually improving our energy usage performance, ***PMI*** can simultaneously minimize accidents and sickness whilst achieving regulatory compliance.

2. ***PMI*** develops GREEN products, strengthen risk and energy management.

3. Purchase energy-saving products, improve the design of the energy performance.

4. Every department participates preserving our environment, energy awareness, and the prevention of injuries, diseases and the reduction of energy consumption.

Based on the above descriptions, ***PMI*** will continue holding every kind of safety, environment and energy activities, increase our international environmental protection image and industry competition, and let the related organizations understand our ambitions and responsibilities to the environment and energy management that people live in.

Quality Policy

The followings are what the employees expect for the quality policy:

Prompt delivery, sustained improvement, satisfying customer's needs and expectations.

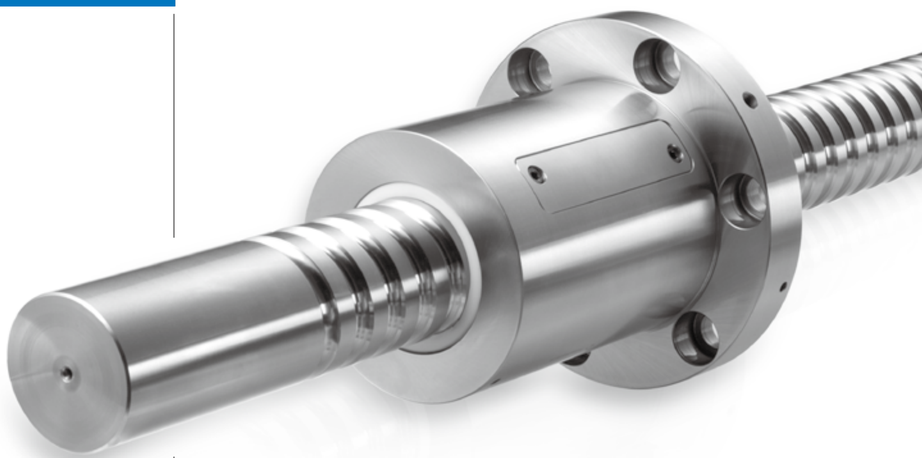
Ballscrews



Features of *PMI* Ballscrews

High reliability

PMI has accumulated many years experience in production managing. It covers the whole production sequence, from receiving the order, designing, material preparation, machining, heat treating, grinding, assembling, inspection, packaging and delivery. The systemized managing ensures high reliability of *PMI* Ballscrews.

High accuracy

PMI Ballscrews are machined, ground, assembled and Q.C. inspected under the constant temperature control (20°C) to ensure high precision of Ballscrews. **Fig.1** accuracy inspection certificate. The ground ball screw which accuracy grade is C5 or above, will attach an accuracy certificate of inspection.

Preload torque(without wipper)Tq:3.0-3.9Kgf-cm	ACCURACY GRADE: C1	REMARK:
		INSPECTOR:

Fig.1 Accuracy inspection certificate.

Long durability

PMI Ballscrews are Alloy steels, which are well quenching and tempering treated for good rigidity, along with suitable surface hardening to ensure long durability.

High working efficiency

Balls are rotating inside the Ballscrew nut to offer high working efficiency. Comparing with the traditional ACME screws, which work by friction sliding between the nut and screw, the Ballscrews needs only 1/3 of driving torque. It is easy to transmit linear motion into rotation motion.

No backlash and with high rigidity

The Gothic profile is applied by ***PMI*** Ballscrews. It offers best contact between balls and the grooves. If suitable preload is exerted on Ballscrew hence to eliminate clearance between the ball nut and screw and to reduce elastic deformation, the ballscrew shall get much better rigidity and accuracy.

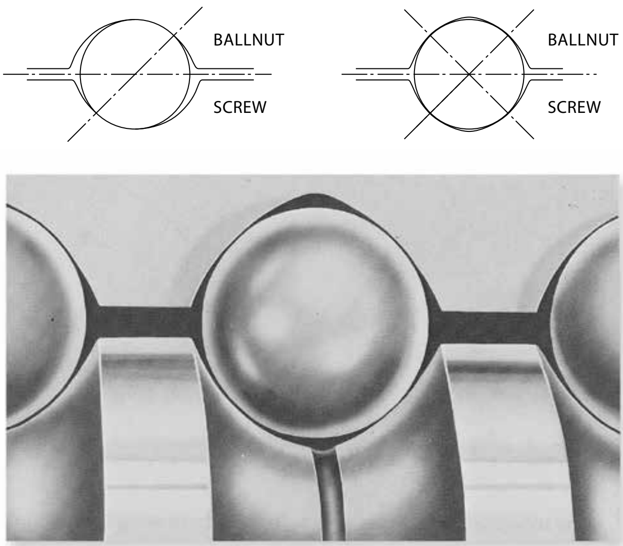

Fig.2 Gothic arch thread

Lead Accuracy and Torque

Lead Accuracy

PMI's precision ground Ballscrews are controlled in accordance with JIS B 1192.
The permissible values and each part of definitions are shown below.

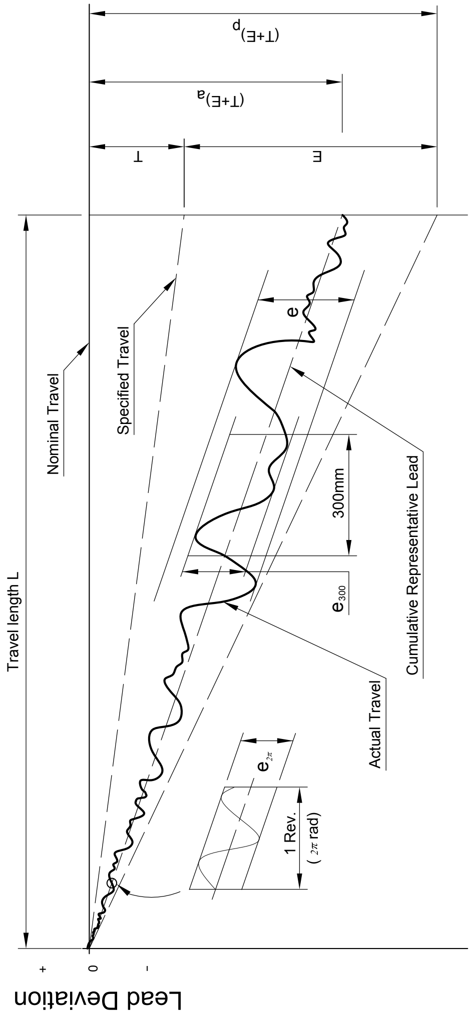

Fig.3 Technical Terms Concerning the Lead

Table 1 Terms

T+E	Cumulative representative lead. A straight line representing the tendency of the cumulative actual lead. This is obtained by least square method and measured by laser system.
P	Permissible value.
a	Actual value.
T	Specified travel. This value is determined by customer and maker as it depends on different application requirements.
E	Accumulated reference lead deviation. This is allowable deviation of specified travel. It is decided by both of the accuracy grade and effective thread length.
e	Total relative lead variation Maximum width of variation over the travel length.
e_{300}	Lead deviation in random 300 mm.
$e_{2\pi}$	Lead deviation in random 1 revolution 2π rad.

Table 2 Accumulated reference lead deviation (±E) and total relative variation (e)

Preloading Torque

The preloading torque of the Ballscrew is controlled in accordance with JIS B 1192.

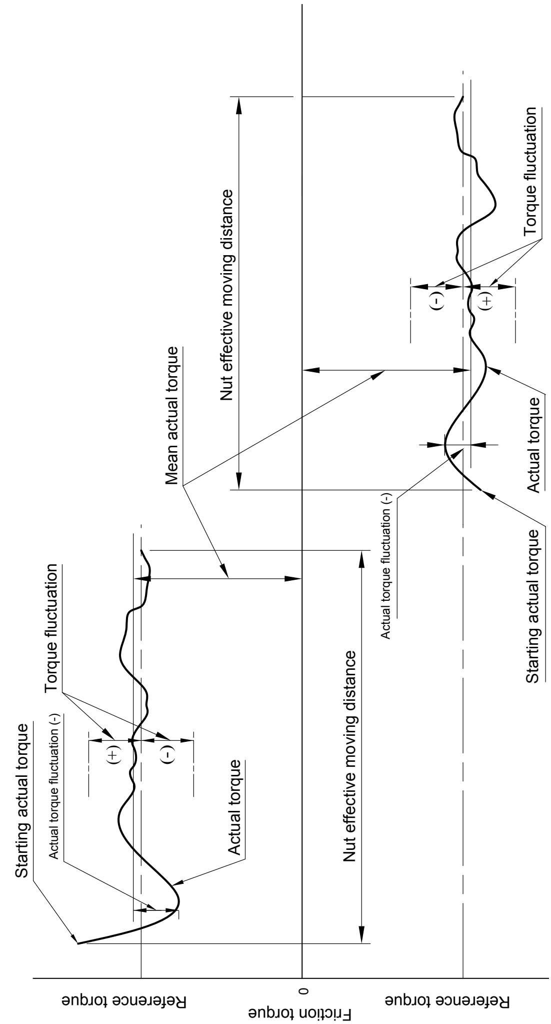

Fig.4 Technical terms concerning preload

Preload	The purpose of preload is to eliminate axial play and increase rigidity of Ballscrew. Reference to **A1-12** Ballscrew's preload and effect.
Preload torque	Torque needed to continuously turn a Ballscrew with preload with no other load applied to it.
Reference torque	Preload torque set as a goal.
Torque fluctuation	Fluctuation from a goal value of the preload torque. Defined as positive or negative in respect to the reference torque.
Rating of torque fluctuation	Rating on reference torque and torque fluctuation.
Actual torque	Preloaded dynamic torque measured by using an actual value of Ballscrew.
Mean actual torque	In the effective thread length, the net reciprocate to measure the maximum actual torque and minimum actual torque are doing count mean.
Actual torque fluctuation	In the effective thread length, the net reciprocate to measure the maximum fluctuant value.
Rating of Actual torque fluctuation	Rating on mean actual torque and actual torque fluctuation.

Tolerances on Various Areas of *PMI* Ballscrew

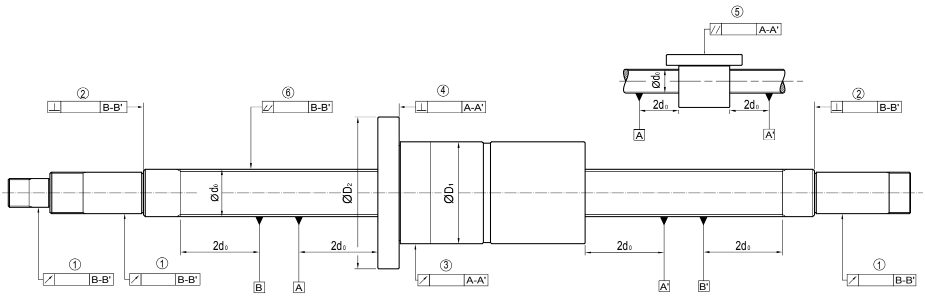

Fig.5

Those on above are samples of accuracy of tolerance on various areas of *PMI* Ballscrew.

⊥ : Perpendicularity **↗ : Radial runout** **// : Parallel** **A : Reference**

Accuracy on various areas of *PMI* Ballscrew has to measure items:

1. Radial run-out of the circumference of the screw shaft supported portion in respect to the B-B' line.
2. Perpendicularity of the screw shaft supported portion end face to the B-B' line.
3. Radial run-out of the nut circumference in respect to the A-A' line.
4. Perpendicularity of the flange mounting surface to the A-A' line.
5. Parallelism between the nut circumference to the A-A' line.
6. Overall radial run-out to the A-A' line.

Note: The mounting surface of the Ballscrew is finished to the accuracy specified in JIS B 1192:1997

Design of Screw Shaft

Production Limit Length of Screw Shaft

Production limit length of precision ground Ballscrew:

When screw shaft O.D. is 4 mm, Limit length of Ballscrew is 150 mm.

When screw shaft O.D. is 120 mm, Limit length of Ballscrew is 10000 mm.

Note: Please contact with our sales people in case a special type is required.

Production limit length of rolled Ballscrew:

When screw shaft O.D. is 8 mm, Limit length of Ballscrew is 1000 mm.

When screw shaft O.D. is 80 mm, Limit length of Ballscrew is 6000 mm.

Note: Please contact with our sales people in case a special type is required.

Mounting Method

The permissible axial load and permissible rotational speed vary with the screw-shaft mounting method used, so the mounting method should be determined in accordance with the operating conditions.

Fig.6~8 illustrate a typical method for mounting a screw shaft.

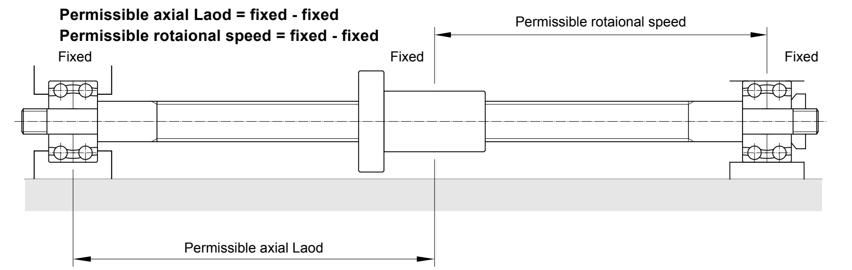

Fig.6 Mount method : fixed-fixed

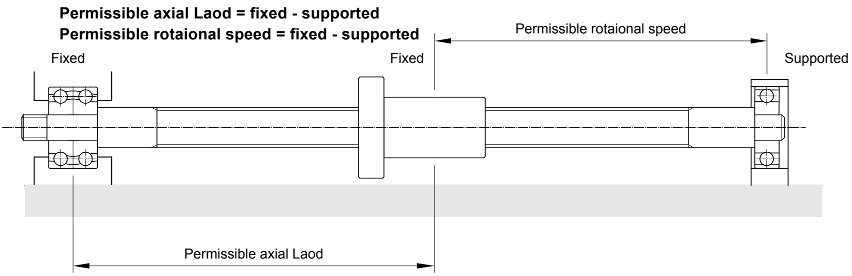

Fig.7 Mount method : fixed-supported

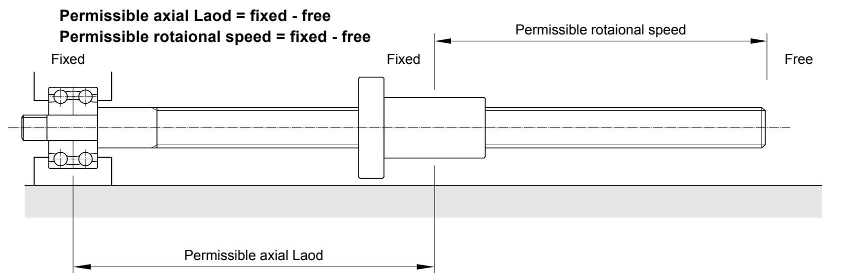

Fig.8 Mount method : fixed-free

Permissible Axial Load

Buckling load

The Ballscrew to be used should not buckle under the maximum compressive load applied in its axial direction. The buckling load can be calculated by using equation **(2)**.

$$P=\alpha\frac{\pi^2 NEI}{L^2}=m\frac{dr^4}{L^2}\times 10^3 \quad (kgf) \cdots\cdots\cdots(2)$$

Here:

α	Safety factor (α=0.5)
E	Young's modulus (E=2.1×10^4 kgf/mm^2)
I	Minimum geometrical moment of inertia of the screw shaft cross section ($I=\pi dr^4/64\ mm^4$)
dr	Screw shaft thread minor diameter (mm)
L	Distance between mounting positions (mm)
m、N	Coefficient depending on the mounting method

supported-supported	m=5.1	(N=1)
fixed-supported	m=10.2	(N=2)
fixed-fixed	m=20.3	(N=4)
fixed-free	m=1.3	(N=1/4)

Permissible tensile-compressive load of the screw shaft

Where the axial load is exerted on the Ballscrew, the screw shaft to be used should be determined in consideration of the permissible tensile-compressive load that can exert yielding stress on the screw shaft.

The permissible tensile-compressive load can be calculated using equation **(3)**.

- Permissible tensile-compressive load of yield stress of screw shaft

$$P=\sigma\cdot A=\sigma\cdot\pi\cdot dr^2/4 \cdots\cdots\cdots\cdots\cdots\cdots\cdots(3)$$

Here:

σ	Permissible tensile-compressive stress ($147MPa$)
A	Cross section area of root diameter of scrrew shaft (mm^2)
dr	Screw-shaft thread minor diameter (mm)

- Permissible Load of contact point of ball groove

The maximal axial load must be less then the basic static rate load of the ball screw shaft. For more details please see **A1-56**, Permissible Load on Thread Grooves.

Fig.Value shown(outer diameter of screw shaft-lead)

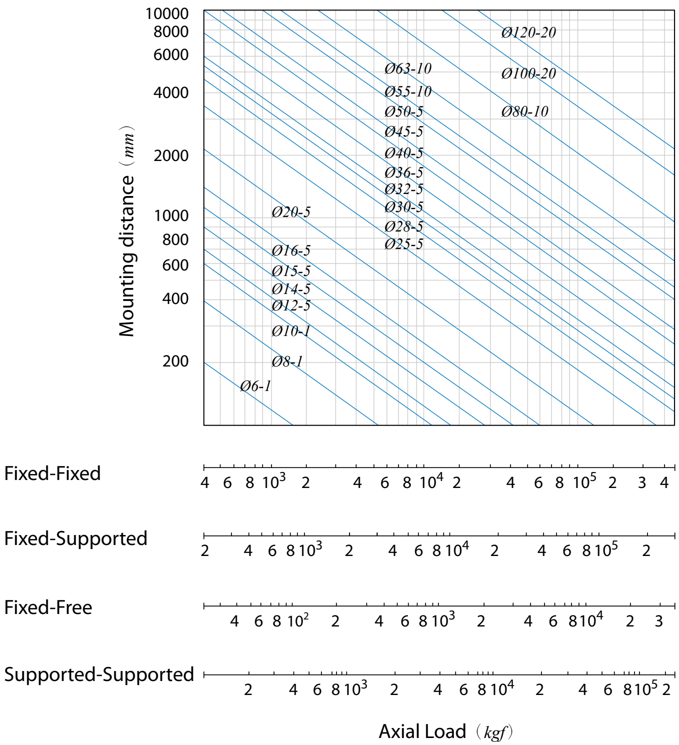

Fig.9 Permissible Axial Load

Permissible Rotational Speed

Critical rotation speed

When the rotation speed of driving motor coincides with the natural frequency of feed system (mainly the ballscrew), the resonance of vibration shall be triggered. This rotation speed is then called critical rotation speed. It shall make bad quality machining, since there is wave shape surface on the workpiece. It may also cause damage of machine. Hence it is very important to prevent the resonance of vibration from happening. We choose 80% of critical rotation speed as allowable speed. It is shown as formula **(4)**.

It may be required to have additional supports in between the ends bearing supports to make the natural frequency of Ballscrew to be higher and hence to raise the allowable rotation speed.

$$n = \alpha \times \frac{60\lambda^2}{2\pi L^2}\sqrt{\frac{EIg}{\gamma A}} = f\frac{dr}{L^2} \times 10^7 \ (rpm) \cdots\cdots\cdots\cdots (4)$$

Here:

n	Permissible rational speed (rpm)
α	Safety factor (α=0.8)
E	Young's modulus (E=2.1×10^4 kgf/mm^2)
I	Minimum geometrical moment of inertia of the screw-shaft cross section ($I=\pi dr^4/64\ mm^4$)
dr	Screw-shaft thread minor diameter (mm)
A	Screw shaft cross-sectional area ($A=\pi dr^2/4\ mm^2$)
L	Distance between mounting positions (mm)
g	Gravitation acceleration (g =9.8×10^3 mm/s^2)
γ	Specific gravity (γ=7.8×10^{-6} kgf/mm^3)
f、λ	Coefficient depending on the mounting method

supported-supported	f=9.7	($\lambda=\pi$)
fixed-supported	f=15.1	(λ=3.927)
fixed-fixed	f=21.9	(λ=4.730)
fixed-free	f=3.4	(λ=1.875)

dm.n Value of Ballscrew

dm is the BCD (ball circle diameter) of screw shaft, and *n* is the maximum rotation speed. The *dm.n* value relates and affects the noise, temperature raise, working life, balls circulation of the ballscrew. In general cases, the *dm.n* value is limited as follows:

Rolled ball screw	Allowable *dm.n* value	Criterion of permissible rotational speed(min^{-1})
Standard specifiction(normal lead)	≤50000	1500~2000
High-speed specifiction(large lead)	≤70000	2000~2500

Product Specification		Allowable *dm.n* value		maximum of turning number (standard) [min^{-1}]
		standard	High-speed	
Ground Ballscrew	Inner circulation	≤70000		2000
	End Deflector	≤220000		3000
	Tube type	≤80000		2500
	E-type circuit	≤130000,≤140000 [1]		3000
	Heavy load	≤130000	≤160000 [2]	3000
	Heavy load series of end deflector		≤120000	2500
	Cap series circuit	≤120000		2500

Note: 1.The dm.n value can be reach 130000 in normal case.For some special cases,for example in a fixed ends case,the dm.n value can be as 140000.

2.As lead are 10mm,12mm,14mm and 16mm,the dm.n value ≤ 120000 As lead are 20mm and 25mm,the dm.n value ≤ 160000.

3.These dm.n values are for reference only. In fact, the dm.n value shall be decided by the ways of end supporting and the distance between them.

4.Please contact with our sales people in case a very high dm.n value is required.

With better manufacturing technology currently, the dm.n value is no longer limited as above. It is even higher than 100,000.

Fig.Value shown(outer diameter of screw shaft-lead)

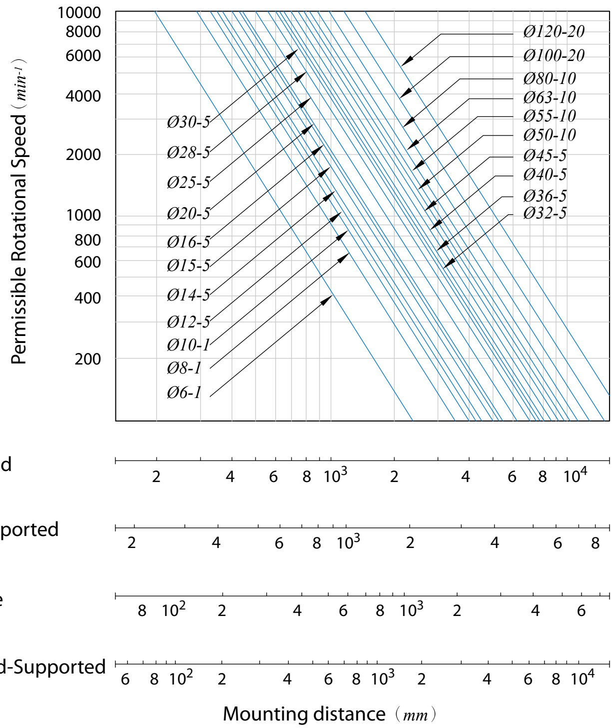

Fig.10 Permissible Rotational Speed

Notes on Screw shaft design

Through end thread

For the Ballscrews with internal ball circulation Ballnut, it is required to have at least one end with complete thread to the end of Ballscrew for Ballnut assembly to screw shaft. If it is impossible for through end thread, it is required to have at least one end with complete thread and the journal area is with diameter to be 0.2mm smaller than the diameter of thread root area.

Fig.11 Incomplete thread

Fig.12 Through end thread

Machine design for the area of Ballnut and ends area of Ballscrew

It is very important to check if there is enough space for assembly of Ballscrew onto the machine during machine design. In some cases, there is not enough space for assembly and the Ballnut has to be disassembled from the screw shaft for easier work. It may cause problems, such as the balls falling out from Ballnut, worse accuracy of squareness and roundout of Ballnut, change of preload and damage to external ball circulating tubes. In some more serious cases, the ballscrew may be damaged and not to be used. Please contact with our people if said above disassembling is required.

Not effective hardened area

The threads on screw shaft are hardened by induction hardening. It shall cause about 15mm at both ends of thread area are not hard enough. It is required to pay attention during machine design for the effective thread length of travel.

Extra support unit for long ballscrew

For a long ballscrew, the bending due to self weight might happen. It may cause radial direction load to ballscrew. The radial direction vibration during rotation might also be more serious. To prevent these problems from happening, it may be required to have extra supports for ballscrew in between the existing supports at both ends. There are two types of supports; one is movable to move along the Ballnut. The other one is fixed type; it is located in a fixed position. The Table must be designed not to hit with this support during moving.

Fixed-Fixed

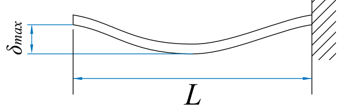
Fixed-Supported

$$\delta_{max} = \frac{\omega L^4}{184.6EI}$$



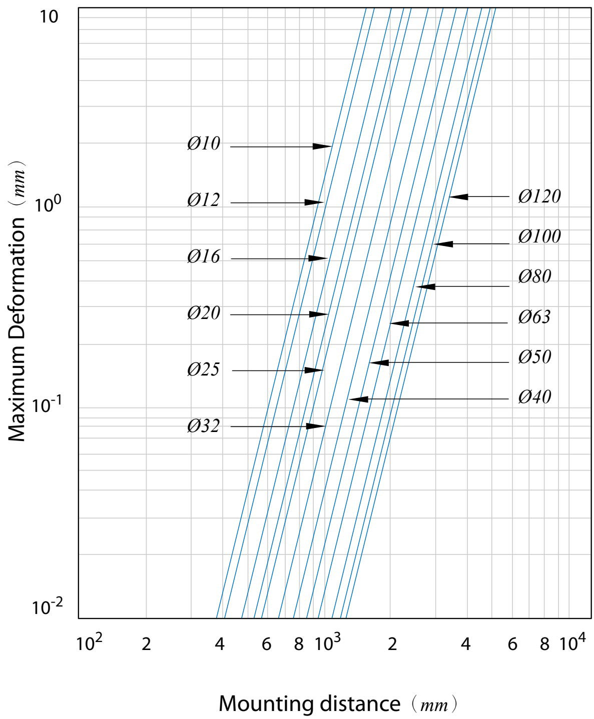


Fig.14 Maximun deformation for fixed-supported

Design of Ball Nut

Selecting the Type of Nut

Type

Selecting the type of Nut, please consider the accuracy; dimension (The length of Nut; internal diameter; external diameter), preload and the date of delivery.

Circulation

External ball circulation

Advantages:

- Lower noise due to longer ball circulation paths
- Offers smoother ball running.
- Offers better solution and quality for long lead or large diameter ballscrews.

Internal ball circulation

Advantages:

- Good for limited space of machine.
- Better structure for small lead or small diameter ballscrews.

Effective turns

Selecting effective turns have to consider required capability; life and rigidity. Refer to the **Table 13**

Flange

PMI have three standard type (A type, B type and C type) Please make selection by area space for nut installation. *PMI* can also make special flange as per customers' requests.

Oil hole

Standard nuts have oil hole. Please dimension in the diagram to manufacture.

Table 13 The character of effective turns

Character	External ball circulation	Internal ball circulation
Motion	1.5circuit ×2row, 1.5circuit ×3row, 2.5circuit ×1row	1circuit ×3row, 1circuit ×4row
Rigidity	2.5circuit ×2row, 2.5circuit ×3row	1circuit ×6row

Calculating the Axial Load

Horizontal reciprocating moving mechanism

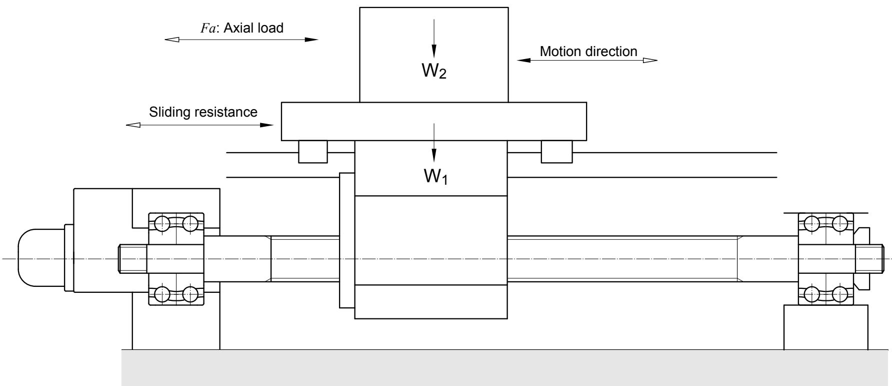

Fig.15 Horizontal reciprocating moving mechanism

For reciprocal operation to move work horizontally (back and forth) in an conveyance system, the axial load (*Fa*) can be gotten using the following equations:

Acceleration (leftward) $Fa_1 = \mu \times mg + f + ma$ ············(5)

Constant speed (leftward) $Fa_2 = \mu \times mg + f$ ··················(6)

Deceleration (leftward) $Fa_3 = \mu \times mg + f - ma$ ···············(7)

Acceleration (rightward) $Fa_4 = -\mu \times mg - f - ma$ ···············(8)

Constant speed (rightward) $Fa_5 = -\mu \times mg - f$ ··················(9)

Deceleration (rightward) $Fa_6 = -\mu \times mg - f + ma$ ············(10)

Here:

a Acceleration

$$a = \frac{V_{max}}{t_a}$$

V_{max} Rapid feed speed

ta time

m Total weight (table weight + work piece weight)

μ Friction coefficient of sliding surface

f Non-load resistance

Vertical Reciprocating Moving Mechanism

For reciprocal operation to move work vertically (up and down) in an conveyance system, the axial load (Fa) can be gotten using the following equations:

Acceleration (upward)	$Fa_1=mg+f+ma$	······(11)
Constant speed (upward)	$Fa_2=mg+f$	············(12)
Deceleration (upward)	$Fa_3=mg+f-ma$	·········(13)
Acceleration (downward)	$Fa_4=mg-f-ma$	·········(14)
Constant speed (downward)	$Fa_5=mg-f$	············(15)
Deceleration (downward)	$Fa_6=mg-f+ma$	·········(16)

Here:

a Acceleration

$$a=\frac{V_{max}}{t_a}$$

V_{max} Rapid feed speed

ta time

m Total weight(table weight + work piece weight)

μ Friction coefficient of sliding surface

f Non-load resistance

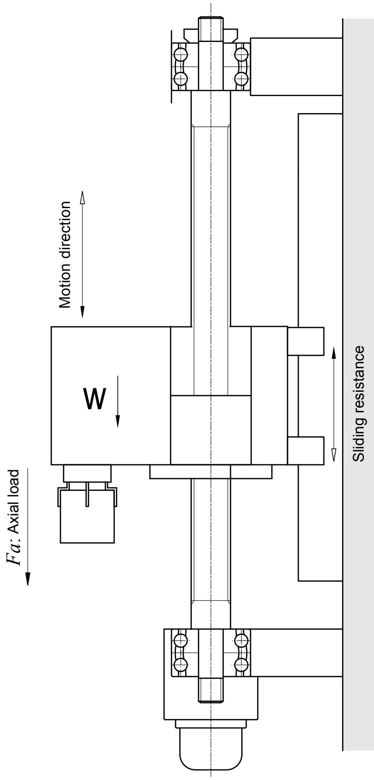

Fig.16 Vertical reciprocating moving mechanism

Notes on Ball Nut Design

Abnormal load: (torsional load or radial load)

When Ballscrew takes only axial load, the best performance of it shall be found; the balls on the groove in between the Ballnut and screw shaft shall evenly take the load and rotate smoothly. In case there is torsional load or radial load on Ballnut, this kind load shall be taken unevenly by some balls only. It shall badly affect Ballscrew performance and even shorten ballscrew life. It is recommended to pay more attention to the mechanism design and Ballscrew assembly.

Axial Rigidity

"Lost Motion" shall happen due to weakness of rigidity of screw shaft and mating components of it. In order to get good positioning accuracy, it is necessary to consider axial and torsional rigidity of screw shaft and mating components of it.

Axial Rigidity of the Feed-Screw System

Let the axial rigidity of a feed-screw system be K. Then, the elastic displacement in the axial direction can be obtained using equation **(17)**.

$$\delta = \frac{Fa}{K_T} \quad \cdots\cdots (17)$$

$$\frac{1}{K_T} = \frac{1}{K_S} + \frac{1}{K_N} + \frac{1}{K_B} + \frac{1}{K_H} \quad \cdots\cdots (18)$$

Here:

δ Feed-screw system elastic displacement in the axial direction (μm)

Fa Axial load (kgf)

K_T Axial rigidity of the feed-screw system ($kgf/\mu m$)

K_S Axial rigidity of the screw shaft ($kgf/\mu m$)

K_N Axial rigidity of the Nut ($kgf/\mu m$)

K_B Axial rigidity of the support bearing ($kgf/\mu m$)

K_H Rigidity of the Nut Bracket and support bearing bracket ($kgf/\mu m$)

Axial rigidity of Screw shaft: K_S

The axial rigidity of a screw shaft varies depending on the shaft mounting method.

- fixed - free (Axial direction)

$$K_S = \frac{A \times E}{x} \times 10^{-3} \quad \cdots\cdots\cdots\cdots (19)$$

Here:

K_S Axial rigidity of Screw shaft ($kgf/\mu m$)

A Screw shaft cross-sectional area ($A=\pi.\ dr^2/4\ mm^2$)

dr Screw shaft thread minor diameter (mm)

E Young's modulus (E=2.1×10^4 kgf/mm^2)

x Distance between mounting positions (mm)

- fixed - fixed (Axial direction)

$$K_S = \frac{A \times E \times L}{x(L - x)} \times 10^{-3} \quad \cdots\cdots\cdots\cdots (20)$$

Here:

K_S Axial rigidity of Screw shaft ($kgf/\mu m$)

L Distance between mounting positions (mm)

Note: Which $x=L/2$, Ks becomes the minimum and the elastic displacement in the axial direction the maximum.

Fixed-Free

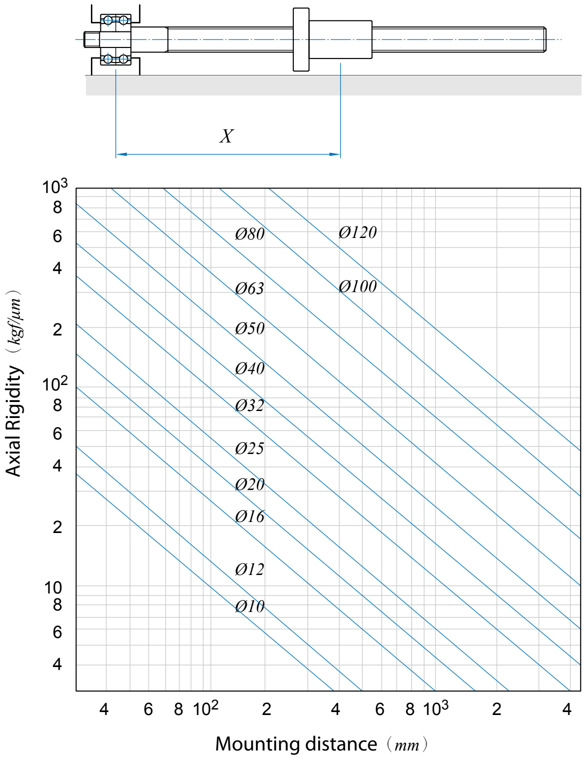

Fig.17 Rigidity of ball screw shaft (Fixed-Free)

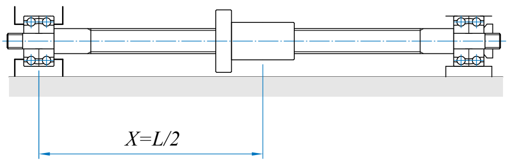
Fixed-Fixed



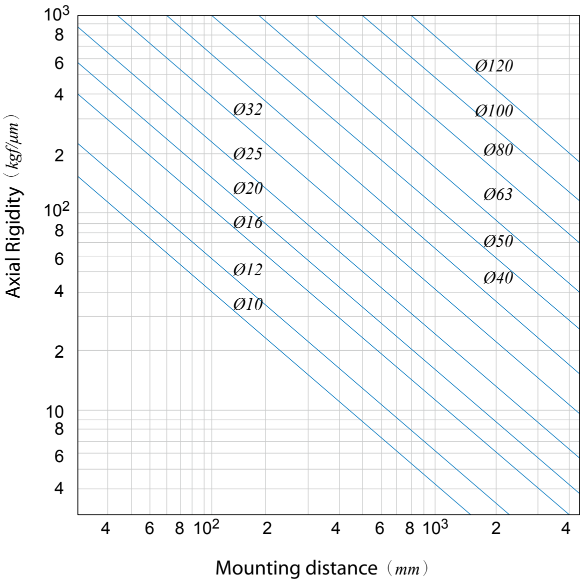


Fig.18 Rigidity of ball screw shaft (Fixed-Fixed)

Axial rigidity of Nut: K_N

Computation of the elastic displacement can be using equation **(21)**:

$$\delta_a = \frac{C}{\sin\alpha}\left(\frac{Q^2}{D_W}\right)^{1/3} \times \zeta \ \ (\mu m) \ \cdots\cdots\cdots\cdots\cdots\cdots(21)$$

Here:

- C A constant (reference C≒2.4)
- α Contact angle of ball and grooved
- D_ω Ball diameter (mm)
- Q Load of each balls (Q=Fa/Z. $\sin\alpha$ kgf)
- Z Number of balls
- ξ A coefficient of accuracy and inter conformation

• Non-preload type

Dimension tables include theoretical axial rigidity values when the axial load with a magnitude of 30% of the basic dynamic load rating (Ca) is exerted on the Nut. These values, don't consider the rigidity of the Nut mounting brackets. Therefore, as a general rule, take 80% of the values given in the table.

When the axial load with a magnitude other than 30% of the basic dynamic load rating (Ca) is exerted on the Nut, rigidity value can be calculated using equation **(22)**.

$$K_N = 0.8 \times K\left(\frac{Fa}{0.3Ca}\right)^{1/3} \ \cdots\cdots\cdots\cdots\cdots\cdots(22)$$

Here:

- K Rigidity value given in the dimension table($kgf/\mu m$)
- Fa Axial load (kgf)
- Ca Basic dynamic load rating (kgf)

• Preloaded type

Dimension tables include theoretical axial rigidity values when the axial load with a magnitude of 10% of the basic dynamic load rating (Ca) is exerted on the Nut. These values, don't consider the rigidity of the Nut mounting brackets. Therefore, as a general rule, take 80% of the values given in the table.

When the axial load with a magnitude other than 10% of the basic dynamic load rating (Ca) is exerted on the Nut, rigidity value can be calculated using equation **(23)**.

$$K_N = 0.8 \times K \left(\frac{Fao}{\varepsilon \times Ca} \right)^{1/3} \quad \cdots\cdots\cdots\cdots\cdots\cdots\cdots (23)$$

Here:

K Rigidity value given in the dimension table ($kgf/\mu m$)

Fao Preload (kgf)

ε A coefficient of rigidity
ε=0.10(spacer prload and offset preload)
ε=0.05(oversize prload)

Ca Basic dynamic load rating (kgf)

Axial rigidity of support bearing: K_B

The axial rigidity of the support bearings for the Ballscrew varies by bearing type.

A typical calculation for determining the axial rigidity of an angular ball bearing can be made using equation **(24)**.

$$K_B = \frac{3Fao}{\delta_{ao}} \quad \cdots\cdots\cdots\cdots\cdots\cdots\cdots (24)$$

Here:

δao Displacement in the axial direction.

$$\left.\begin{aligned} \delta_{ao} &= \frac{0.44}{\sin\alpha}\left(\frac{Q^2}{D_W}\right)^{1/3} \\ Q &= \frac{Fao}{Z \times \sin\alpha} \end{aligned}\right\} \quad \cdots\cdots\cdots\cdots\cdots\cdots\cdots (25)$$

Fao Preload of the suport bearing (kgf)

α Initial contact angle of the support bearing (°)

D_ω Ball diameter of the support bearing (mm)

Q Load of each balls

Z Number of balls

Axial rigidity of nut bracket and support bearing bracket: K_H

Take this into consideration in the design of your system. Setting the rigidity as high as possible.

Torsional rigidity of the feed-screw system

The factors of positions error caused by twisting are:

- Torsional deformation of screw shaft.
- Torsional deformation of coupling.
- Torsional deformation of motor.

But above deformations are too small in general machine (non-high speed machine), they are then ignored.

Ballscrew's preload and effect

In order to get high positioning accuracy, there are two ways to reach it. One is commonly known as to clear axial play to zero. The other one is to increase Ballscrew rigidity to reduce elastic deformation while taking axial load. Both two ways are done by preloading.

Methods of preloading

- Double-nut method:

A spacer inserted between two nuts exerts a preload. There are two ways for it.

One is illustrated in **Fig.19** That is to use a spacer with thickness complies with required magnitude of preload. The spacer makes the gap between Nut A and B to be bigger, hence to produce a tension force on Nut A and B. It is called "extensive preload".

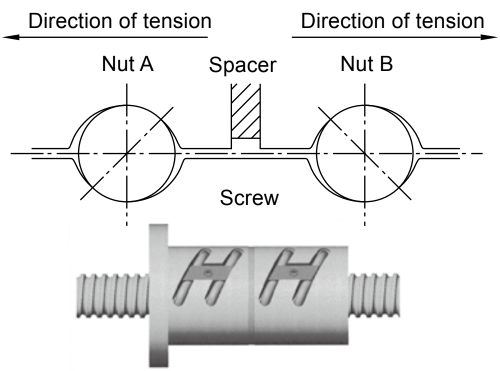

Fig.19 Extensive preload

Illustrated in **Fig.20**, is using a thinner spacer. The thickness complies with required magnitude of preload. The spacer is smaller than the gap between Nut A and B, compressing Nut A and B on opposite direction to preload Ballscrews. It's called "compressive preload".

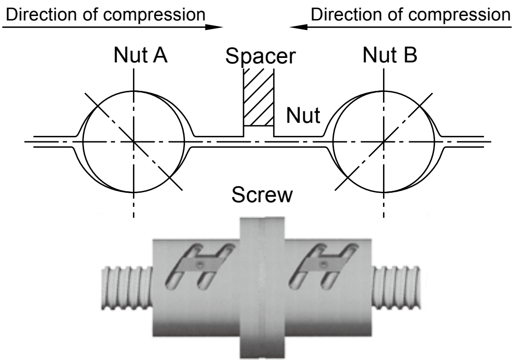

Fig.20 Compressive preload

• Single-nut method:

As that illustrated on **Fig.21**, using oversize balls onto the space between Ballnut and screw to get required preload. The balls shall make four-point contact with grooves of Ballnut and screw.

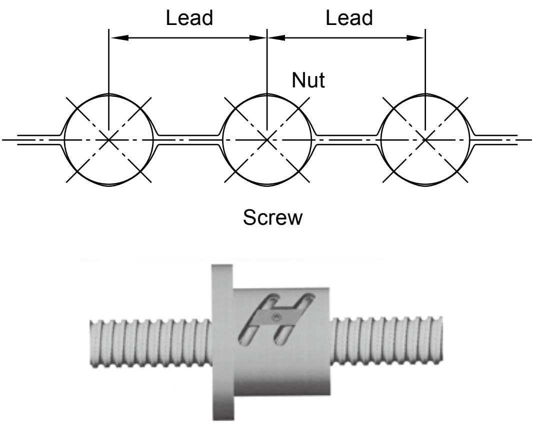

Fig.21 Four-point contact preload

There is another way for single nut Ballscrew preloading. That is to shift a very little distance, which complies with required magnitude of preload, on one lead of Ballnut as that illustrated on **Fig.22** to preload Ballscrew.

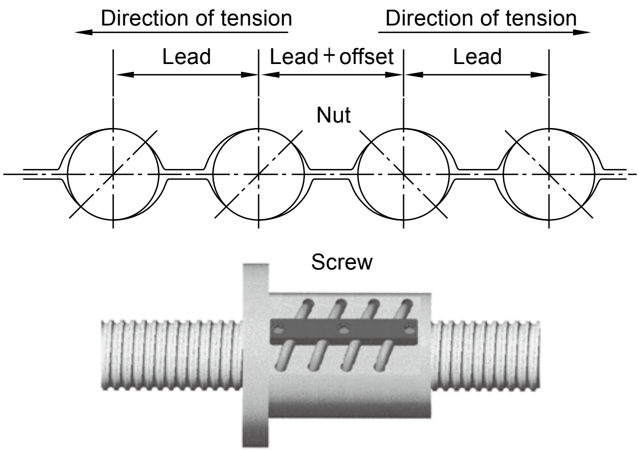

Fig.22 Lead offset preload

Relation between preload force and elastic deformation

Fig.23, Nuts A and B are assembled with preloading spacer. The preload forces on Nut A and B are Fao, but with reversed direction. The elastic deformation on both Nuts are δao.

Then there is a external axial force Fa applied to Nut A as shown on **Fig.24**. The deformation of Nut A and B becomes:

$$\delta_A = \delta_{a0} + \delta_{a1}$$
$$\delta_B = \delta_{a0} - \delta_{a1}$$

The load in nut A and nut B are:

$$F_A = F_{ao} + F_a - F_a' = F_a + F_p$$
$$F_B = F_{ao} - F_a' = F_p$$

Note: F_A and F_B are opposite direction.

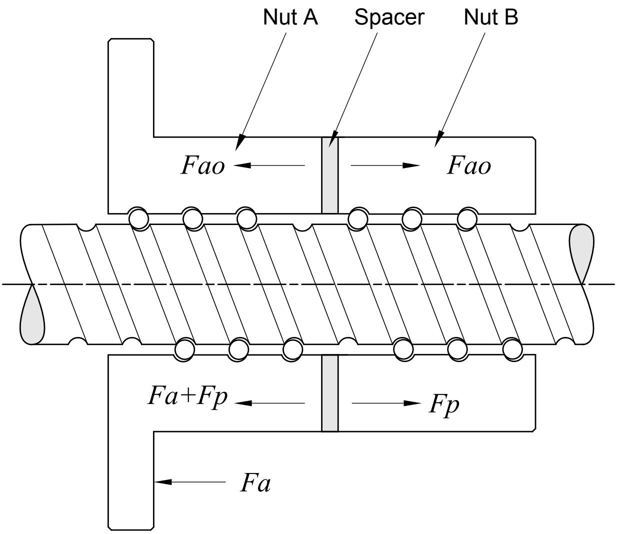

Fig.23 Double-nut positioning preload

It means Fa is offset with an amount Fa' because of the deformation of Nut B decreases. As a result, the elastic deformation of Nut A is reduced. This effect shall be continued until the deformation of Nut B becomes zero, that is, until the elastic deformation $\delta a1$ caused by the external axial force equals δao, and the preload force applied to Nut B is completely released. The formula related the external axial force and elastic deformation is shown as below:

$\delta_{a0} = K \times Fao^{2/3}$ and $2\delta_{a0} = K \times F_l^{2/3}$

$(F_l / Fao)^{2/3} = (2\delta_{a0} / \delta_{a0}) = 2$

$F_l = 2.8Fao \fallingdotseq 3Fao$

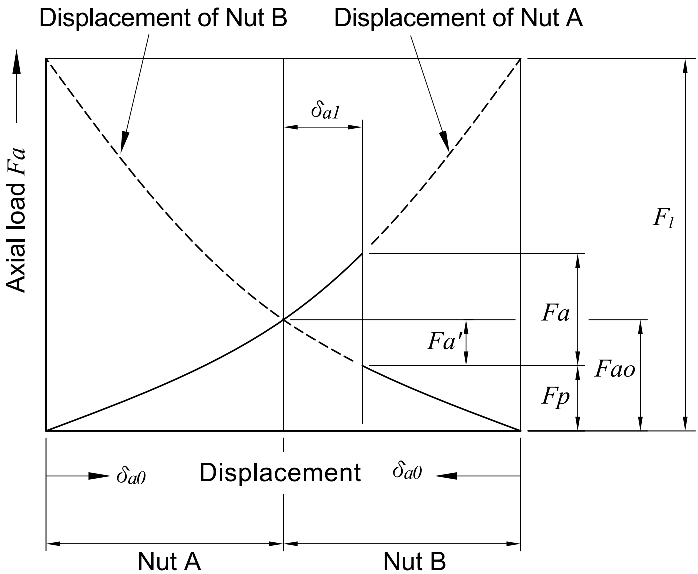

Fig.24 Positioning preload diagram

Therefore, the preload amount of a ballscrew is recommended to set as 1/3 of its axial load. Too much preload for a Ballscrew shall cause temperature raise and badly affect its life. However, taking the life and efficiency into consideration, the maximum preload amount of a Ballscrew is commonly set to be 10% of its rated basic dynamic load.

Shown on **Fig.25**, with the axial load to be three times as the preload, the elastic displacement for the non-preloaded ball nut is two times as that of the preloaded nut.

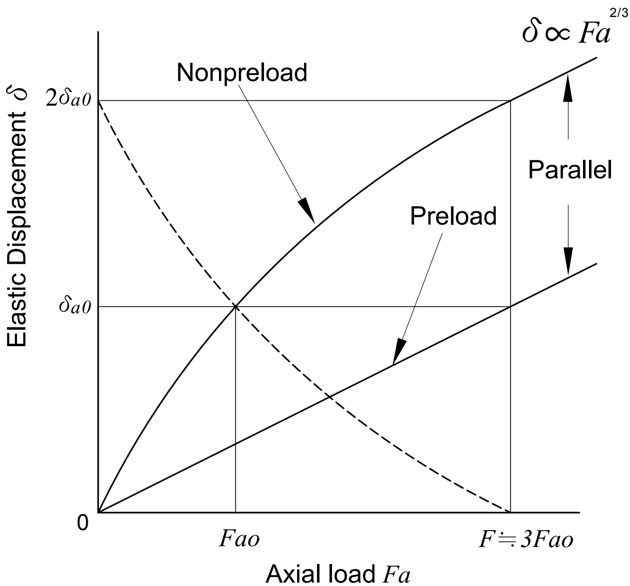

Fig.25 Elastic Displacement of the Ballscrew

Positioning Accuracy

Causes of Error in Positioning Accuracy

Lead error and rigidity of feed system are common causes of feed accuracy error. Other causes like thermal deformation and feed system assembly are also playing important roles in feed accuracy.

Selecting the Lead Accuracy

Refer to **page[A1-4]**, the Specified travel line should coincide with the nominal travel line. However, in order to compensate either the elongation caused by the thermal expansion during machine operating or the shortening of length due to external load, the specified travel may be set to be positive or negative to the Nominal travel. Machine designer can show the value of Specified travel on the drawing for our manufacturing, or, we can help to decide it based on our more than ten years experience.

There is another way to compensate thermal effect by "pretension" to Ballscrew. Generally, the pretension force shall elongate the Ballscrew to be equivalent to the thermal expansion at about 2-3˚C.

Considering Thermal Displacement

If the screw-shaft temperature increases during operation, the heat elongates the screw shaft, thereby reducing the positioning accuracy. Expansion and shrinkage of a screw shaft due to heat can be calculated using equation **(26)**.

$$\Delta L_\theta = \rho \cdot \theta \cdot L \quad \cdots\cdots\cdots\cdots (26)$$

Here:

ΔL_θ Thermal displacement (μm)

ρ Thermal-expansion coefficient (12 $\mu m/m$˚C)

θ Screw-shaft temperature change (˚C)

L Ballscrew length (mm)

That is to say, an increase in the screw shaft temperature of 1˚C xpands the shaft by 12 μm per meter. The higher the Ballscrew speed, the greater the heat generation. Thus, temperature increases reduce positioning accuracy. Where high accuracy is required, anti-temperature-elevation measures must be provided as follows:

To control temperature:

- Selecting appropriate preload.
- Selecting correct and appropriate lubricant.
- Selecting larger lead for the Ballscrew and decrease the rotation speed.

Compulsory cooling:

- Ballscrew with hollow cooling.
- Lubrication liquid or cooling air can be used to cool down external surface of Ballscrew.
- Nut cooling system: to reduce temperature of nut by cooling liquid through it.

To keep off effect upon temperature raise:

- Set a negative cumulative lead target value for the Ballscrew.
- Warm up the machine to stable machine's operating temperature.
- Pretension by using on Ballscrew while installing onto the machine.
- Use the Closed-loop positioning control.

Life of the Ballscrew

Even though the Ballscrew has been used with correct manner, it shall naturally be worn out and can no longer be used for a specified period. Its life is defined by the period from starting use to ending use caused by nature fail.

a.Fatigue life - Time period for surface flaking off happened either on balls or on thread grooves.

b.Accuracy life - Time period for serious loosing of accuracy caused by wearing happened on thread groove surface, hence to make Ballscrew can no longer be used.

Fatigue Life

The basic dynamic rate load (Ca) of the Ballscrew is used to calculate its fatigue life when it is operated under a load.

Basic dynamic rate load Ca

The basic dynamic rate load (Ca) is the revolution of 10^6 that 90% of identical Ballscrew units in a group, when operated independently of one another under the same conditions, can achieve without developing flaking.

Fatigue life

Calculating life

There are three ways to show fatigue life:

- Total number of revolutions
- Total operating time.
- Total travel.

$$L = \left(\frac{Ca}{Fa \times f_W} \right)^3 \times 10^6 \quad \cdots\cdots(27)$$

$$L_t = \frac{L}{60 \times n} \quad \cdots\cdots(28)$$

$$L_s = \frac{L \times l}{10^6} \quad \cdots\cdots(29)$$

here:

- L Fatigue life (total number of revolutions)(rev)
- Lt Fatigue life (total operating time)(hr)
- Ls Fatigue life (total travel)(km)
- Ca Basic dynamic rate load(kgf)
- Fa Axial load(kgf)
- n Rotation speed(rpm)
- l Lead(mm)
- fw Load factor (refer to Table 14)

Table 14 Load factor fw

Vibration and impact	Velocity (V)	fw
Light	V<15 (m/min)	1.0~1.2
Medium	15<V<60 (m/min)	1.2~1.5
Heavy	V>60 (m/min)	1.5~3.0

Too long or too short fatigue life are not suitable for Ballscrew selection. Using longer life make the Ballscrew's dimensions too large. It's an uneconomical result. Following table is a reference of the Ballscrew's fatigue life.

Machine center ····················20,000 hours
Production machine ··············10,000 hours
Automatic controller ··············15,000 hours
Surveying instruments ············15,000 hours

Mean load

When axial load changed constantly. It is required to calculate the mean axial load (Fm) and the mean rotational speed (Nm) for fatigue life. Setting axial load (Fa) as Y-axis; rotational number ($n.t$) as X-axis. Getting three kind curves or lines:

- Gradational variation curve (**Fig.26[A1-53]**)

Mean load can be calculated by using equation **(30)**:

$$F_m = \left(\frac{F_1^{\,3} \cdot n_1 \cdot t_1 + F_2^{\,3} \cdot n_2 \cdot t_2 + \cdots\cdots + F_n^{\,3} \cdot n_n \cdot t_n}{n_1 \cdot t_1 + n_2 \cdot t_2 + \cdots\cdots + n_n \cdot t_n} \right)^{\frac{1}{3}} \quad \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots (30)$$

Mean rotational speed can be calculated by using equation **(31)**:

$$N_m = \frac{n_1 \cdot t_1 + n_2 \cdot t_2 + \cdots\cdots + n_n \cdot t_n}{t_1 + t_2 + \cdots\cdots + t_n} \quad \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots (31)$$

Axial load (kgf)	Rotation speed (rpm)	Time Ratio (Sec or $\%$)
F_1	n_1	t_1
F_2	n_2	t_2
.	.	.
.	.	.
.	.	.
F_n	n_n	t_n

• Similar straight line (**Fig.27**)

When mean load variation curve like similar straight line. Mean rotational speed can be calculated using equation **(32)**.

$$F_m=1/3(F_{min}+2F_{max}) \quad \cdots\cdots(32)$$

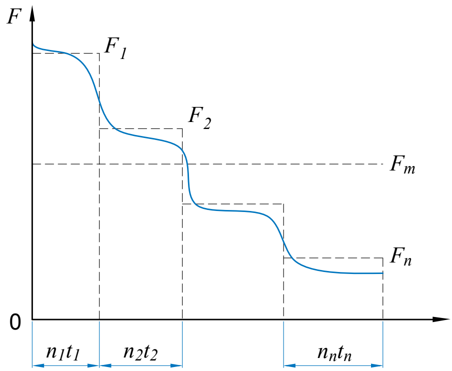

Fig.26 Gradational variation curve's load

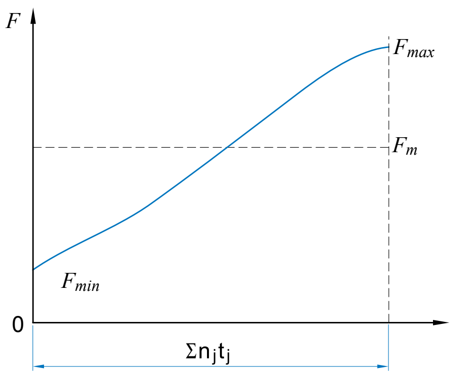

Fig.27 Similar straight line's load

• Sine curve there are two cases

1.When mean load variation curve shown as the **Fig.28** below. Mean rotational speed can be calculated by using equation **(33)**:

$F_m = 0.65F_{max}$ ··································(33)

2.When mean load variation curve shown as the **Fig.29** below. Mean rotational speed can be calculated by using equation **(34)**:

$F_m = 0.75F_{max}$ ··································(34)

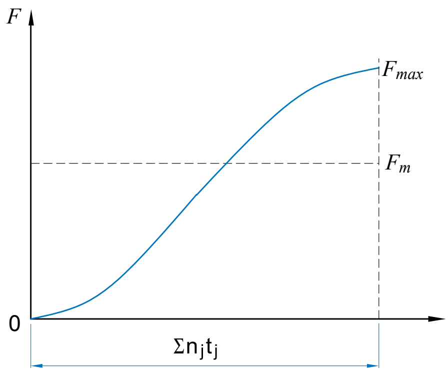

Fig.28 Variation like Sine curve's load (1)

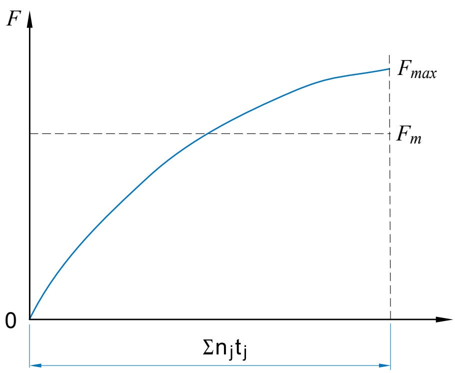

Fig.29 Variation like Sine curve's load (2)

Affection of installation errors

When twist load or radial load is applied to Ballscrew, there shall be bad effect on ballscrew operation and its life, It is required to make the feed system (Ballscrew, support bearings, Guideways) to be more rigid. Hence to reduce. installation errors.

Ballscrews must be meticulously installed onto the Yoke (bracket) of machine to achieve precise pallelism and squareness along moving direction of moving parts. It is very important to ensure minimum backlash happens.

Scales of reference calculate for support torque of ball screw, allow **Fig.30**

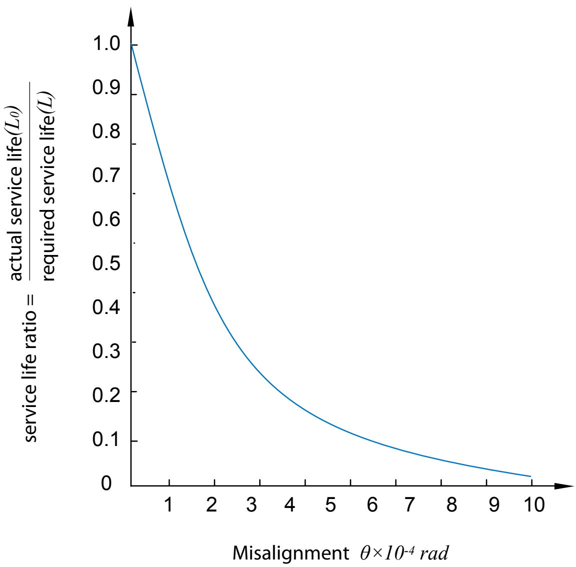

Fig.30 The effect on service life of a radial load caused by misalignment

Permissible Load on Thread Grooves

Even though the Ballscrew is seldom operated and is operated under low velocity, it is required to make the maximum load to be far smaller than its rated basic static load when making selection.

Basic static rate load Co

The basic static rate load is the static load with a non-varying direction and magnitude that makes the sum of the permanent deformation of the rolling elements and raceway 0.0001 times the rolling element diameter. With the Ballscrew, the basic static rate load is defined in relation to the axial load.

Permissible axial load

$$F_{max} = Co / fs$$

REMARKS		PASS OR NOT		Q.C.CHIEF		INSPECTOR	

Lubrication

Lithium base lubricants are used for Ballscrew lubrication.

Their viscosity are 30~140 cst (40˚C) and ISO grades of 32~100.

Selecting:

1.High speed or Low temperature application: Using the lower viscosity lubricant.

2.High temperature, high load and low speed application: Using the higher viscosity lubricant.

Table 16 Checking and supply interval of lubricant

Manner	Checking interval	Checking item	Supply or replacing interval
Automatic interval oil supply	every week	oil volume and purity	To supply on each check, its volume depends on oil tank capacity
Lubricating grease	Within 2-3 months after starting operation of machine	foreign matter	Normally supply once a year as per the result of check
Oil bath	everyday before operation of machine	oil surface	To supply as per wasting condition

Table 17 calculate of supply lubricate oil

Lubrication method	Principles of inspection and add
oil	Checked and add depending on the tank capacity every week. Oil should be changed when oil is dirty. Calculation of oil Capacity: Capacity of supply oil every 10 min. $Q = \frac{\text{Shaft diameter } (mm)}{90}$ $c.c.$ ……(35)

Table 18 calculate of supply lubricate grease

Lubrication method	Principles of inspection and add
grease	Checked every 2~3 months after begin of the operation and see whether foreign matter. Change grease when dirty. Add grease depending on the use condition and operation environment. The add capacity should be the 50% of the internal volume of the nut. Avoid using different brands of grease

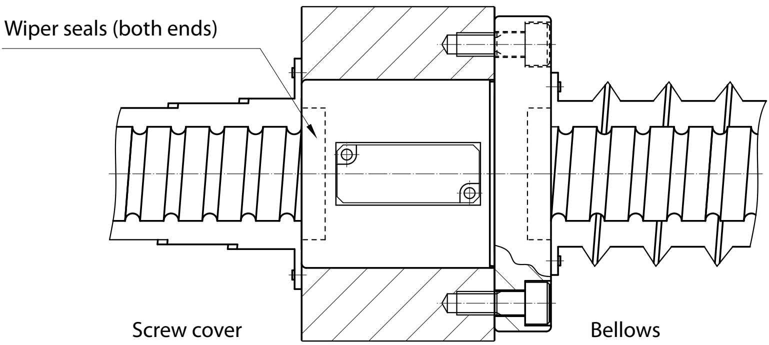
Dustproof

Same as the rolling bearings, if there is the particles such as chips or water get into the ballscrew, the wearing problem shall be deteriorated. In some serious cases, ballscrew shall then be damaged. In order to prevent these problems from happening, there are wipers assembly at both ends of ballnut and please use the Screw cover or Bellows for better dustproof. Should there be any more information required, please contact us. There is also the "O-Ring" at the wipers to seal the lubrication oil from leaking from ballnut.



Dustproof by screw cover and belows

Driving Torque

Operating Torque of Ballscrew

Normal Drive

Rotational motion converted to linear motion is called normal drive. The torque required can be obtained by using equation **(37)**

$$T_a = \frac{Fa \times l}{2\pi \times \eta_1} \quad \cdots\cdots (37)$$

Here:

- Ta Normal operation torque
- Fa Axial load
- l Lead
- η Normal efficiency

Reverse operation

Linear motion converted rotational motion is called reverse operation motion. The torque required can be obtained using equation **(38)**

$$T_b = \frac{Fa \times l \times \eta_2}{2\pi} \quad \cdots\cdots (38)$$

Here:

- T_b Reverse operation torque
- η_2 Reverse efficiency

Preload torque

Friction torque due to preload on the Ballscrew, The torque required can be obtained by using equation **(39)**

$$T_p = k \times \frac{Fao \times l}{2\pi} \quad \cdots\cdots (39)$$

here:

- Tp Preload torque
- Fao Preload
- k Coefficient of preload torque see equation **(1)** **[A1-12]**

$k = 0.05 \times (tan\beta)^{-0.5}$

Drive Torque of Motor

Driving torque at constant speed

The torque can counteract load and let Ballscrew to rotate uniformly is called driving torque for constant speed. Driving torque = preloading torque + friction torque for axial load + friction torque for bearing.

$$T_1 = \left(k \times \frac{Fao \cdot l}{2\pi} + \frac{Fa \cdot l}{2\pi \cdot \eta} + T_B \right) \times \frac{N_1}{N_2} \quad \cdots\cdots (40)$$

Here:

- T_1 Driving torque at constant speed
- Fao Preload
- Fa Axial load
- F Cutting resistance
- μ Guiding surface friction coefficient
- W Total weight (Working table weight + Working object weight)
- T_B Friction torque for bearing
- N_1 Gear one
- N_2 Gear two

In general, driving torque of constant speed motion shall not over than 30% of rated torque of motor.

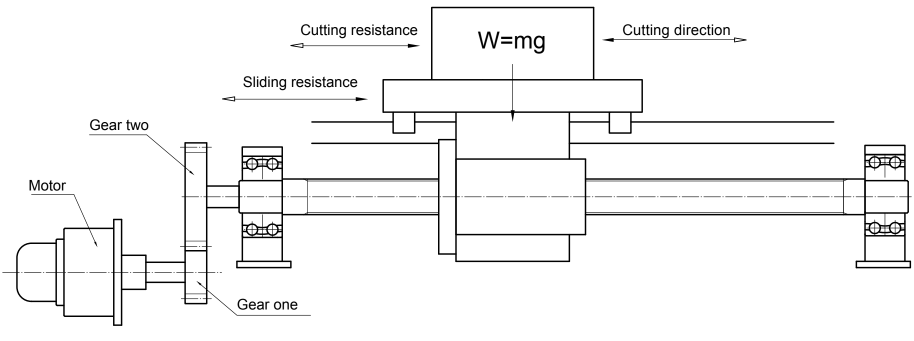


Fig.32 Cutting machine diagram

Driving torque at constant acceleration

The torque required to counteract load and to let Ballscrew to rotate at constant acceleration is driving torque at constant acceleration.

$$T_2 = T_1 + J \cdot \dot{\omega} \quad \cdots\cdots(41)$$

$$J = J_M + J_{G1} + \left(\frac{N_1}{N_2}\right)^2 \times \left[J_{G2} + J_{SH} + J_w + J_C\right] \quad \cdots\cdots(42)$$

$$J_w = \frac{m}{g}\left(\frac{l}{2\pi}\right)^2 \quad \cdots\cdots(43)$$

Here:

Design Conditions

Table weight: $W_1 = 1100\ kg$

Work piece weight: $W_2 = 800\ kg$

Max. travel: $S_{max} = 1000\ mm$

Rapid feed speed: $V_{max} = 14\ m/min$

Life: $L_t = 25000\ h$

Sliding surface friction coefficient: $\mu = 0.1$

Driving motor: $N_{max} = 2000\ rpm$

Positioning accuracy: $\pm 0.030/1000\ mm$ (no load)

Repeatability accuracy: $\pm 0.005\ mm$ (no load)

Lost Motion: $0.02\ mm$ (no load)

Mechanical Conditions

Kinds of Operation \ Calculation data	Axial load (kgf)		Feed speed	Time
	Cutting resistance	Sliding resistance	mm/min	ratio(%)
Rapid feed	0	190	14000	30
Light cutting	500	190	600	55
Heavy cutting	950	190	120	15

Sliding resistance: $Fa = \mu\ (W_1 + W_2)$

$= 0.1 \times (1100 + 800)$

$= 190\ (kgf)$

Items to Be Decided

- Screw nominal O.D., Lead, Type of Nut
- Accuracy grade
- Thermal displacement
- Driving motor

Selecting Screw nominal O.D., Lead, Nut

- Lead(l):

The highest rotation speed of motor

$$l \geqq \frac{V_{max}}{N_{max}} = \frac{14000}{2000} = 7\ (mm)$$

◎Lead have to be 7mm or more.

(As per ***PMI*** catalog: select 8 and 10 mm for further analysis)

- Basic dynamic rate load (Ca)

Kinds of Operation \ Calculation data	Axial load	Feed speed		Time
	-	$l=8$	$l=10$	ratio(%)
Rapid feed	$F_1=190$	$N_1=1750$	$N_1=1400$	$t_1=30$
Light cutting	$F_2=690$	$N_2=75$	$N_2=60$	$t_2=55$
Heavy cutting	$F_3=1140$	$N_3=15$	$N_3=12$	$t_3=15$

Calculation of mean load and mean rotation

Mean load $$F_m = \left(\frac{F_1^3 \cdot n_1 \cdot t_1 + F_2^3 \cdot n_2 \cdot t_2 + \cdots\cdots + F_n^3 \cdot n_n \cdot t_n}{n_1 \cdot t_1 + n_2 \cdot t_2 + \cdots\cdots + n_n \cdot t_n} \right)^{\frac{1}{3}}$$

Mean rotation $$N_m = \frac{n_1 \cdot t_1 + n_2 \cdot t_2 + \cdots\cdots + n_n \cdot t_n}{t_1 + t_2 + \cdots\cdots + t_n}$$

Lead l (mm)	8	10
Mean load F_m (kgf)	330	330
Mean rotation N_m (rpm)	569	455

Calculation of basic dynamic rate load

$$L = \left(\frac{Ca}{Fa \times f_w}\right)^3 \times 10^6 \qquad L_t = \frac{L}{60N_m}$$

$\Rightarrow$ $Ca = (60N_m \times L_t)^{1/3} \times F_m \times f_w \times 10^{-2}$

As per design Conditions:

L_t = 25000 (*hours*)

f_w = 1.2

When l=8(*mm*) ....$Ca \geqq$ 3756 (*kgf*)
If life > 25000 (*hours*) is needed,
Ca must be > 3756 (*kgf*)
When l=10(*mm*) ....$Ca \geqq$ 3487 (*kgf*)
If life > 25000 (*hours*) is needed,
Ca must be > 3487 (*kgf*)

- Selecting the type of nut

In case stiffness is a major concern, lost motion becomes less important, following specifications are to be selected:

1.External circulation Ballscrew

2.Type: FDWC

3.Number of circuit: B×2 or B×3

The value of Ca can be found as per this catalog: Unit: (*kgf*)

Screw nominal O.D.(*mm*)	lead 8 (*mm*)		lead 10 (*mm*)	
	B×2	B×3	B×2	B×3
32	3210	-	4660	-
36	3265	-	4930	-
40	3410	-	5220	-
45	3650	5175	5480	7760
50	3900	5520	5790	8200

• Selecting screw shaft diameter

Ballscrew shaft diameter can be decided by critical rotation speed of high speed feed.

Assume both of the supporting ends are fixed.

So the permissible rotational speed :

$$n = \alpha \times \frac{60\lambda^2}{2\pi L^2}\sqrt{\frac{EIg}{\gamma A}} = f\frac{dr}{L^2}\times 10^7$$

$$\Rightarrow \quad dr \geqq \frac{n \times L^2}{f} \times 10^{-7}$$

L = Max. stroke + Nut length/2 + Unthread area length

= 1000 + 100 + 200 = 1300 (mm)

Screw shaft supported method is fixed-fixed

$\Rightarrow$ f = 21.9

when l =8 (mm) .... $dr \geqq$ 13.5 (mm)

If the highest rotational speed reaches 1750 rpm,

screw shaft diameter at thread root area must be bigger than 14 mm.

◎So screw shaft diameter shall be ranged in between 20 and 50 mm.

When l =10 (mm) .... $dr \geqq$ 10.8 (mm)

If the highest rotational speed reaches 1400 rpm,

screw shaft diameter at thread root area must be biggerthan 11 mm.

◎So screw shaft diameter shall be ranged in between 16 and 50 mm.

• Considering rigidity

By initial conditions:

Lost motion ： 0.02 mm (no load)

Assume total displacement of components (including screw shaft, ballnut and support bearing) of feed system is 0.016 mm. Thus the unilateral elastic displacement of feed system is $\Delta L \leqq 8(\mu m)$

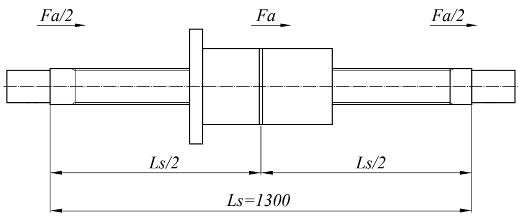
Axial rigidity of the screw shaft: Ks

Elastic displacement of the screw shaft: ΔL_S

$$K_S = \frac{A \times E \times L}{x(L-x)} \times 10^{-3}$$

The smallest elastic displacement is in the middle of screw shaft.

From following diagram Using $x = L/2$



$$\Rightarrow \; K_S = \frac{\pi \times dr^2 \times E}{Ls} \times 10^{-3}$$

$$\Delta L_S = \frac{Fa}{K_S} = \frac{Fa \times L_S}{\pi \times dr^2 \times E} \times 10^{3}$$

Here Fa is sliding resistance of 190 (kgf)

The results are in the **[A1-76] Table**

Axial rigidity of the nut: K_n

Elastic displacement of the nut: ΔL_n

Setting the preload to be 1/3 of maximum axial load.

$$Fao = F_{max} / 3 = 1140 / 3 = 380\,(kgf)$$

$$K_n = 0.8 \times K \left(\frac{Fao}{\varepsilon \times Ca} \right)^{1/3}$$

$\varepsilon = 0.1$, then

$$\Delta L_n = \frac{Fa}{K_n}$$

The results are in the **[A1-76] Table**

Nut model no.	dr	Ca	K	Screw		Nut		Total
				K_s	ΔL_s	K_n	ΔL_n	ΔL
32-10B2-FDWC	27.05	4660	125	37.1	5.1	93.0	2.0	7.1
36-10B2-FDWC	31.05	4930	138	48.9	3.9	101.2	1.9	5.8
40-10B2-FDWC	35.05	5220	151	62.3	3.0	108.7	1.7	4.7
45-10B2-FDWC	38.05	5480	167	73.5	2.6	118.3	1.6	4.2
50-10B2-FDWC	42.05	5790	182	89.7	2.1	126.5	1.5	3.6

◎With the condition of $\Delta L \leqq 8$ (μm)

Make following selection by ignoring the bearing rigidity, economical and safety consideration:

Type of Ballscrew: 40-10B2-FDWC

Screw shaft diameter: 40 (mm)

Lead: 10 (mm)

- Length of Ballscrew

L = Max. travel + Nut length + Unthreaded area length (including journal ends length)

= 1000+180+100

= 1280

≒ 1300 (mm)

- Preliminary check

a. Fatigue life

$$L_t = \left(\frac{Ca}{F_m \times f_w}\right)^3 \times 10^6 \times \frac{1}{60n}$$

$$= \left(\frac{5220}{330 \times 1.2}\right)^3 \times 10^6 \times \frac{1}{60 \times 455}$$

$$\fallingdotseq 83900\ (hours) \geq 25000\ (hours)$$

b. Permissible rotational speed

$$n = f \times \frac{dr}{L^2} \times 10^7$$
$$= 4540\ (rpm)$$

Critical speed of screw shaft is 4540(rpm). It is much bigger than the maximum rotational speed of design. So the Ballscrew selected is safe.

Selecting lead accuracy

Positioning accuracy required: ±0.030/1000 mm (Max. travel) Refer to **Table 2[A1-6]**, accumulated reference lead deviation (±E) and total relative variation (e)

Accuracy grades: C4

E = ±0.025/1250 (mm)

e = 0.018 (mm)

Considering thermal displacement

According to the load capability of support bearings, make the specified travel (T) compensation to be 3˚C

• Thermal displacement: ΔL_θ

$$\Delta L_\theta = \rho \cdot \theta \cdot L$$
$$= 12.0 \times 10^{-6} \times 3 \times 1300$$
$$= 0.047\ (mm)$$

• Pretension force: F_θ

$$F_\theta = \Delta L_\theta \times K_S = \frac{\Delta L_\theta \cdot E \cdot \pi dr^2}{4L}$$
$$= \frac{0.047 \times 2.1 \times 10^4 \times \pi \times 27.05^2}{4 \times 1300}$$
$$= 436\ (kgf)$$

Specified Travel (T): -0.047/1300

Pretension force: 436 (kgf)

Stretching: -0.047 (mm)

Selecting driving motor

<Required specifications>

The highest rotation speeds is 1500 (rpm)

Time required to reach highest rotational speed is within 0.15 sec.

• Inertial

a. Screw shaft:

$$GD_S^2 = \frac{\pi\rho}{8} \times D^4 \times L = \frac{\pi \times 7.8 \times 10^{-3}}{8} \times 4^4 \times 130 = 101.9\ (kgf \cdot cm^2)$$

b. Moving parts:

$$GD_w^2 = W\left(\frac{l}{\pi}\right)^2 = (1100+800) \times \left(\frac{1.0}{\pi}\right)^2 = 192.5\ (kgf \cdot cm^2)$$

c. Coupling:

$$GD_J^2 = 40\ (kgf \cdot cm^2)$$

d. Total of inertial:

$$GD_L^2 = GD_S^2 + GD_w^2 + GD_J^2 = 334.4\ (kgf \cdot cm^2)$$

• Driving torque

In this case, the time sharing of machine working at acceleration condition is limited. Assuming the machine works at constant speed, the torque caused by angular acceleration is then neglected.

a. Preloading torque:

$$T_P = k \times \frac{Fao \times l}{2\pi} = 0.18 \times \frac{380 \times 1.0}{2\pi} = 10.8\ (kgf \cdot cm)$$

$$k = 0.18$$

$$Fao = F_{max}/3$$

b. Friction torque

Rapid feed:

$$T_a = \frac{Fa \times l}{2\pi \times \eta} = \frac{190 \times 1.0}{2\pi \times 0.9} = 33.6\,(kgf \cdot cm)$$

Light cutting:

$$T_b = \frac{690 \times 1.0}{2\pi \times 0.9} = 122.1\,(kgf \cdot cm)$$

Heavy cutting:

$$T_c = \frac{1140 \times 1.0}{2\pi \times 0.9} = 201.7\,(kgf \cdot cm)$$

The maximum required driving torque is preloading torque plus friction torque of heavy cutting.

$$T_L = T_p + T_c$$
$$= 212.5(kgf \cdot cm)$$

• Selecting driving motor

<Selecting conditions>

a. The highest rotation speed: $N_{max} \geqq 1500\ (rpm)$

b. Rated torque: $T_M > T_L$

c. Rotor inertia: $J_M \geqq J_L / 3$

The specifications required for driving motor are then decided as per above conditions.

◎Motor specifications:

Output	W_M=3.6 (kW)
Highest rotation speeds	N_{max}=1500 (rpm)
Rated torque	T_M=22.6 $(N.m)$
Rotor inertia	$GD^2{}_M$=750 $(kgf.cm^2)$

• Check required time period for reaching highest rotation speed

$$t_a = \frac{J}{T'_M - T_L} \times \frac{2\pi N}{60} \times f$$

Here

J : Total inertia $\quad J = \dfrac{GD^2}{4g}$

$T'_M = 2 \times T_M$

T_L : Rotation Torque (rapid)

f : Safe factor (choose 1.4 for this case)

$$t_a = \frac{(334.3+750)}{4 \times 980 \times (2 \times 230 - (18.1+33.6))} \times \frac{2\pi \times 1400}{60} \times 1.4 = 0.139\ (sec) < 0.15\ (sec)$$

This above motor specifications match design needs.

Calculating the stress of the Ballscrew

$$\sigma = \frac{F}{A} = \frac{F_{max}}{\pi dr^2/4} = \frac{1140 \times 9.8 \times 4}{\pi \times 35.05^2} = 11.56\ N/mm^2 = 1.16 \times 10^7\ N/m^2$$

(dr is screw shaft thread root diameter)

$$dr = 40 + 1.4 - 6.35 = 35.05\ (mm)$$

$$\tau = \frac{T \times r}{J} = \frac{21540 \times 20}{148167} = 2.91\ N/mm^2 = 2.91 \times 10^6\ N/m^2$$

$$T_{max} = T_L = 219.8 (kgf \cdot cm) = 21540\ (N \cdot mm)$$

$$J = \frac{\pi dr^4}{32} = \frac{\pi (35.05^4)}{32} = 148167\ (mm^4)$$

$$\sigma_{max} = \sqrt{\sigma^2 + \tau^2}$$
$$= 11.9 \times 10^6\ N/m^2$$

50CrMo4 steel tension strength is $1.1\times10^{8}\ N/m^{2} > \sigma_{max}$
Yield strength is $0.9\times10^{8}\ N/m^{2} > \sigma_{max}$

◎So the Ballscrew selected is safe.

Calculating the buckling load of the screw shaft

$$P=\alpha\frac{\pi^{2}nEI}{L^{2}}=m\frac{dr^{4}}{L^{2}}\times10^{3}=20.3\times\frac{35.05^{4}}{1100^{2}}\times10^{3}=25300\ (kgf) > F_{max}\ (1140\ kgf)$$

◎So the Ballscrew selected is safe.

High Speed Porterage Apparatus (Horizontal application)

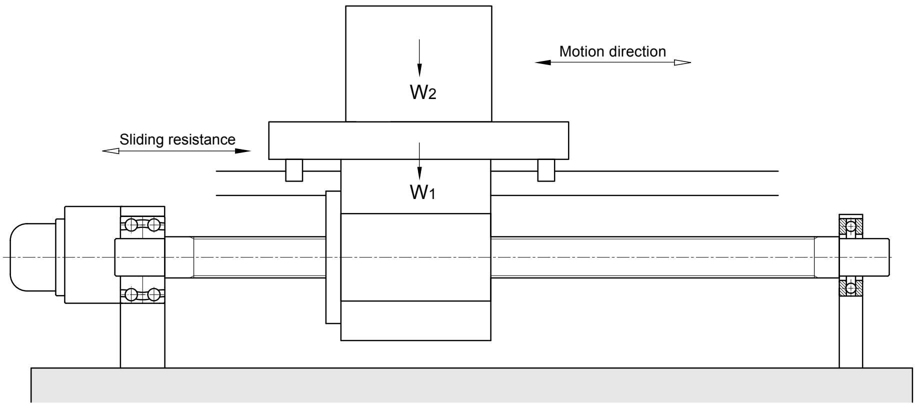


Fig.34 High speed porterage apparatus

Design Conditions

Table weight:	$W_1 = 50\ kg$
Work piece weight:	$W_2 = 25\ kg$
Max. travel:	$S_{max} = 1000\ mm$
Rapid feed speed:	$V_{max} = 50\ m/min$
Life:	$L_t = 25000\ hours$
Guiding surface friction coefficient:	$\mu = 0.01$
Driving motor:	$N_{max} = 3000\ rpm$
Positioning Accuracy:	±0.10/at max. travel
Repeatability Accuracy:	±0.01 mm

Motion Conditions

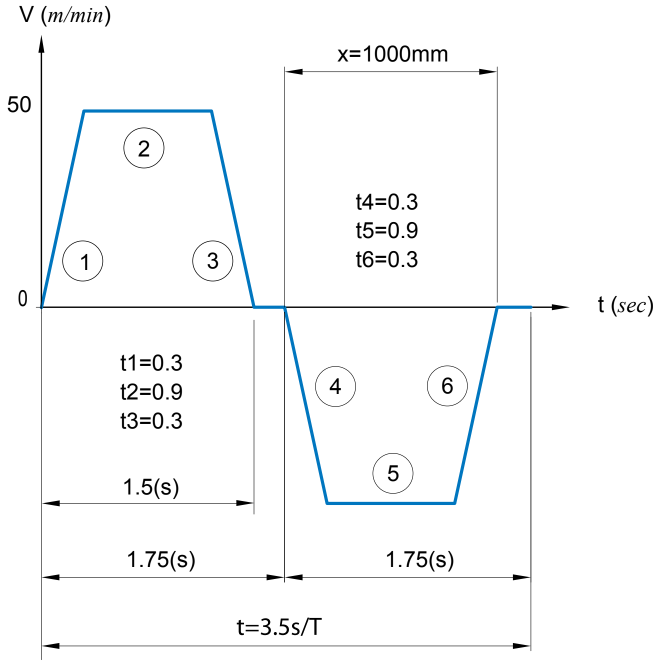

Fig.35 Porterage apparatus v-t diagram

Items to be decided

- Screw nominal O.D., Lead
- Accuracy grade
- Type of nut
- Driving motor

Selecting Screw nominal O.D., Lead

- Lead (l)

The highest rotation speed of motor

$$l \geqq \frac{V_{max}}{N_{max}} = \frac{50000}{3000} \fallingdotseq 17\ (mm)$$

◎Lead have to be $18\ mm$ or more.

(As per ***PMI*** catalog : select 20 mm for further analysis)

If lead is 20 mm, the highest rapid feed speed 50 m/min shall be reached as long as the motor rotates at 2500 rpm.

- Initial selection of screw shaft length

L = Max. travel + Nut length + Unthreaded area length

= 1000 + 100 + 100 = 1200 (mm)

- Selecting screw shaft diameter

Ballscrew shaft diameter can be decided by critical rotation speed of high speed feed.

Assume the supporting ends are fixed-supported.

So the permissible rotational speed :

$$n = \alpha \times \frac{60\lambda^2}{2\pi L^2}\sqrt{\frac{EIg}{\gamma A}} = f\frac{dr}{L^2} \times 10^7$$

$$\Rightarrow\ dr \geqq \frac{n \times L^2}{f} \times 10^{-7}$$

L = Max. travel + Nut length/2 + Unthread area length

= 1000 + 50 + 100 = 1150 (mm)

Screw shaft support method is fixed-supported

f = 15.1

$dr \geqq 21.9\ (mm)$

If the high rotational speed is 2500 *rpm,*

Diameter at thread root area must be bigger than 22 *mm.*

◎So Screw-shaft diameter shall be ranged in between 25 and 36 *mm*

• Considering service life

First to analyze **Fig.35[A1-83]** (V-t diagram)

The speed line is a straight one, hence it is a constant acceleration, periodically reciprocating motion.

Maximum velocity ︰ Vmax = 50 (m/min) = 0.83 (m/s)

Acceleration time ︰ $t_1 = 0.3\ (s)$

Deceleration time ︰ $t_3 = 0.3\ (s)$

a.Running distance during acceleration

$$x_1 = \left(\frac{V_0 + V}{2}\right) \times t = \left(\frac{0+0.83}{2}\right) \times 0.3$$

$$= 0.125\ (m) = 125\ (mm)$$

b. Running distance during constant speed

$$x_2 = V \cdot t = 0.83 \times 0.9$$

$$= 0.75\ (\mathrm{m}) = 750\ (mm)$$

c.Running distance from highest speed to stop

$$x_3 = \left(\frac{V_0 + V}{2}\right) \times t = \left(\frac{0.83+0}{2}\right) \times 0.3 = 0.125\ (m) = 125\ (mm)$$

d. The line segment

$$a_1 = \frac{V_{max}}{t_1} = \frac{0.833}{0.3} = 2.8\ (m/s^2)$$

$$F_1 = \mu(W_1+W_2) \times g + (W_1+W_2) \times a_1 = 0.01 \times (50+25) \times 9.8 + (50+25) \times 2.8 = 217\ (N)$$

$$N_1 = n_{max}/2 = 2500/2 = 1250\ (rpm)$$

e. The line segment

$$F_2 = f = \mu(W_1+W_2) \times g = 0.01 \times (50+25) \times 9.8 = 7.35\ (N)$$

$$N_2 = 2500\ (rpm)$$

f. The line segment

$$F_3 = \mu(W_1+W_2)\times g + (W_1+W_2)\times a_3 = 0.01\times(50+25)\times9.8+(50+25)\times(-2.8) = -203\ (N)$$

$$N_3 = n_{max}/2 = 2500/2 = 1250\ (rpm)$$

Whence the relationship between the applied axial load, running distance, time and mean rotation can be as follows:

Motion	Axial load	Running distance	Time	Mean rotation
Acceleration forward	217	125	0.3	1250
Constant speed forward	7.35	750	0.9	2500
Deceleration forward	-203	125	0.3	1250
Acceleration returning	-217	125	0.3	1250
Constant speed returning	-7.35	750	0.9	2500
Deceleration returning	203	125	0.3	1250

g. Calculation of mean load and mean rotation:

$$F_m = \left(\frac{F_1^{\,3}\cdot n_1\cdot t_1 + F_2^{\,3}\cdot n_2\cdot t_2 + \cdots + F_n^{\,3}\cdot n_n\cdot t_n}{n_1\cdot t_1 + n_2\cdot t_2 + \cdots + n_n\cdot t_n}\right)^{\frac{1}{3}} = \left(\frac{217^3\times1250\times0.6+7.35^3\times2500\times1.8+203^3\times1250\times0.6}{1250\times0.6+2500\times1.8+1250\times0.6}\right)^{\frac{1}{3}}$$

$$= 132.4\ (N)$$

$$N_m = \frac{n_1\cdot t_1 + n_2\cdot t_2 + \cdots + n_n\cdot t_n}{t} = \frac{1250\times0.6+2500\times1.8+1250\times0.6}{3.5} = 1714\ (rpm)$$

h. Calculation of life

$$L_t = \left(\frac{Ca}{F_m\times f_w}\right)^3\times\frac{1}{60N_m}\times10^6 = \left(\frac{1170\times9.8}{132.4\times2.5}\right)^3\times\frac{1}{60\times1714}\times10^6$$

$$= 404000 \ \geqq 25000\ (hours)$$

◎Above conforms design requirements.

Selecting accuracy grade

Positioning accuracy of ±0.1/1000 mm (Max. travel) From **page.A1-6**

Accuracy grade: C5

E = ±0.040/1000

e = 0.027

Selecting Ballscrew type

Considering operation conditions, effective turns of A1 is selected.

Selecting following type:

R25-20A1-FSWE-1000-1160-0.018

Screw-shaft support method is fixed-supported

Selecting driving motor

<Required specifications>

1.The highest rotation speed of 3000 (rpm)

2.Time required to reach highest rotational speed is within 0.30 sec

- Inertial

a. Screw shaft:

$$J_{SH} = \frac{\pi \rho}{32g} \times D^4 \times L = \frac{\pi \times 7.8 \times 10^{-3}}{32 \times 980} \times 2.5^4 \times 120 = 0.0037 \ (kgf \cdot cm \cdot sec^2)$$

b. Moving parts:

$$J_w = \frac{W}{g}\left(\frac{l}{2\pi}\right)^2 = \frac{25+50}{980}\left(\frac{2}{2\pi}\right)^2 = 0.0078 \ (kgf \cdot cm \cdot sec^2)$$

c. Coupling:

$$J_C = 0.0005 \ (kgf \cdot cm \cdot sec^2)$$

d. Total of Inertial:

$$J_L = J_{sh} + J_w + J_C = 0.012 \ (kgf \cdot cm \cdot sec^2)$$

• Driving torque

a. During constant speed:

$$T_1 = \frac{F_2 \times l}{2\pi \times \eta} = \frac{7.35 \times 2}{2\pi \times 0.9} = 2.6 \fallingdotseq 3.00\ (N \cdot cm)$$

$\eta = 0.9$

b. During acceleration

$$T_2 = T_1 + J\dot{w} = T_1 + (J_L + J_M) \times \frac{2\pi n}{60 t_1} = 3 + (0.009 + 0.01) \times 9.8 \times \left(\frac{2\pi \times 2500}{60 \times 0.3}\right) = 166\ (N \cdot cm)$$

preselet motor, and give the specifications for the rate inertia

$J_M = 0.01\ (kgf \cdot cm \cdot sec^2)$

c. During deceleration

$$T_3 = T_1 - J\dot{w} = T_1 - (J_L + J_M) \times \frac{2\pi n}{60 t_3} = 3 - (0.009 + 0.01) \times 9.8 \times \left(\frac{2\pi \times 2500}{60 \times 0.3}\right) = -160\ (N \cdot cm)$$

• Selecting driving motor

<Selecting conditions>

a. The highest rotation speed: $N_{max} \geqq 3000\ (rpm)$

b. Rated torque -------$T_M > T_L$

c. Rotor inertia -------$J_M \geqq J_L / 3$

The specifications required for driving motor are then decided as per above conditions.

◎Motor specifications:

Output	$W_M = 400\ (kW)$
Highest rotation speeds	$N_{max} = 3000\ (rpm)$
Rated torque	$T_M = 1.27\ (N.m)$
Rotor inertia	$J_M = 0.01\ (kgf.cm.sec^2)$

• Effective torque:

$$T_{rms} = \sqrt{\frac{T_2^2 \times t_a + T_1^2 \times t_b + T_3^2 \times t_c}{t}} = \sqrt{\frac{166^2 \times 0.6 + 3^2 \times 1.8 + 160^2 \times 0.6}{3.5}} = 95\ (N \cdot cm) < 127\ (N \cdot cm)$$

◎ It conforms to design requirements.

- Time required to reach highest rotational speed.

$$t_a = \frac{J}{T_M' - T_L} \times \frac{2\pi n}{60} \times f$$

Here:

J : Total inertia

$T_M' = 2 \times T_M$

T_L : Rotation Torque (rapid)

f : Safe factor (choose 1.4 for this case)

$$t_a = \frac{0.009+0.01}{2 \times 127 \times 3} \times 9.8 \times \frac{2\pi \times 2500}{60} \times 1.4 = 0.27\ (s) < 0.3\ (s)$$

◎It conforms to design requirements.

Calculating the stress of the Ballscrew

$$\sigma = \frac{F}{A} = \frac{F_{max}}{\pi dr^2/4} = \frac{217 \times 4}{\pi \times 22.425^2} = 0.61\ N/mm^2 = 6.1 \times 10^5\ N/m^2$$

$dr = 25+1-4.762 = 21.238\ (mm)$

(dr is screw shaft thread minor diameter)

$$\tau = \frac{T \times r}{J} = \frac{1660 \times 12.5}{24827} = 0.84\ N/mm^2 = 8.4 \times 10^5\ N/m^2$$

$T_{max} = T_L = 166\ (N \cdot cm) = 1660\ (N \cdot mm)$

$$J = \frac{\pi dr^4}{32} = \frac{\pi (22.425^4)}{32} = 24827\ (mm^4)$$

$$\sigma_{max} = \sqrt{\sigma^2 + \tau^2} = 0.10 \times 10^8\ N/m^2$$

50CrMo4 steel tension strength is $1.5 \times 10^8\ N/m^2$

Yield strength is $0\ 9 \times 10^8\ N/m^2$

◎So the Ballscrew selected is safe.

Calculating the buckling load of the screw shaft

$$P = \alpha \frac{\pi^2 nEI}{L^2} = m \frac{dr^4}{L^2} \times 10^3$$

$$= 10.2 \times \frac{22.425^4}{1160^2} \times 10^3$$

$$= 1917\ (kgf) > F_{max}(22.14\ kgf)$$

◎So the Ballscrew selected is safe.

Vertical Porterage Apparatus

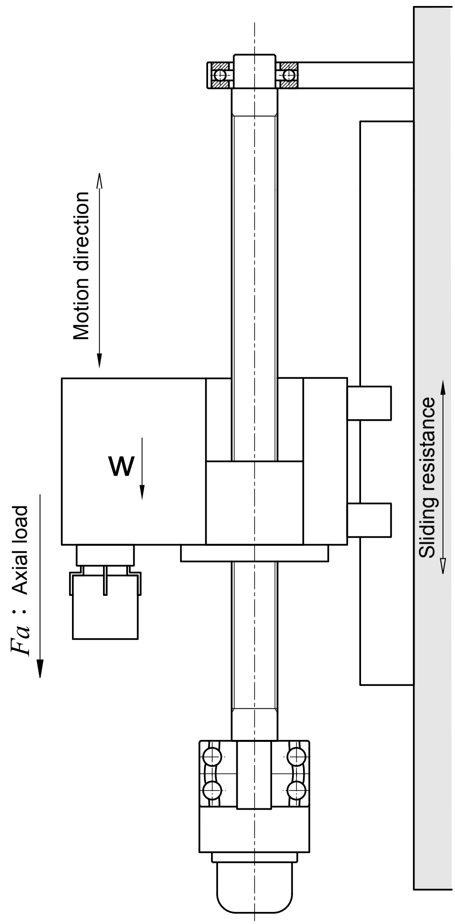

Fig.36 Vertical porterage apparatus

Design Conditions

Table weight:	$W_1 = 300\ kg$
Work piece weight:	$W_2 = 50\ kg$
Max. travel:	$S_{max} = 1500\ mm$
Rapid feed speed:	$V_{max} = 15 \times 10^3\ mm/min$
Life:	$Lt = 20000\ hours$
Guiding surface friction coefficient:	$\mu = 0.01$
Driving motor:	$N_{max} = 1500\ rpm$
Positioning accuracy:	$\pm 0.8/1500\ mm$
Repeatability accuracy:	$\pm 0.3\ mm$

Motion Conditions

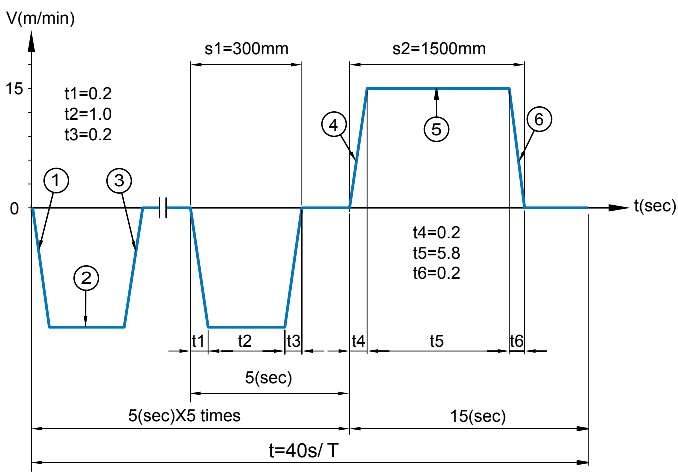

Fig.37 Porterage apparatus v-t diagram

Items to be decided:

- Accuracy grade
- Screw nominal O.D., Lead
- Driving motor

Selecting accuracy grades

As per design condition: positioning accuracy required: 0.8/1500 *mm*

$$\frac{\pm 0.8}{1500} = \frac{\pm 0.16}{300}$$

Refer to **Table 2[A1-6]**, accumulated reference lead deviation (±E) and total relative variation (e)

Accuracy grades C7
E=±0.05/300 *mm*
◎So the porterage apparatus can use Rolled Ballscrew.

Selecting screw nominal O.D., Lead

- Lead (l)：

The highest rotation speed of motor

$$l \geqq \frac{V_{max}}{N_{max}} = \frac{15000}{1500} = 10\ (mm)$$

◎ Lead have to be 10 *mm* or more.

(As per ***PMI*** catalog : select 10 *mm* for further analysis)

- Permissible axial load

Setting up is positive.

a.Force during acceleration (downward)

$$a_1 = \frac{V_{max}}{t_1} = \frac{15000}{60\times 0.2} = 1250\ (mm/s^2) = 1.25\ (m/s^2)$$

$$f = \mu\,(W_1+W_2)\times g = 0.01(300+50)\times 9.8 = 35\ (N)\ \text{(Friction)}$$

$$F=ma \rightarrow F_1=(W_1+W_2)\times g-f-(W_1+W_2)\times a_1 = 2958\ (N)$$

b. Force during constant speed (downward)

$$F=0 \rightarrow F_2=(W_1+W_2)\times g-f = 3395\ (N)$$

c. Force during deceleration (downward)

$$F=ma \rightarrow F_3=(W_1+W_2)\times g-f+(W_1+W_2)\times a_3 = 3833\ (N)$$

d. Force during acceleration (upward)

$$F=ma \rightarrow F_4=(W_1+W_2)\times g+f+(W_1+W_2)\times a_4 = 3903\ (N)$$

e. Force during constant speed (upward)

$$F=0 \rightarrow F_5=(W_1+W_2)\times g+f = 3465\ (N)$$

f. Force during deceleration (upward)

$$F=ma \rightarrow F_6=(W_1+W_2)\times g+f-(W_1+W_2)\times a_6 = 3028\ (N)$$

So

$$Fa_{max}=F_4 = 3903\ (N)$$

• Buckling load:

$$P=\alpha\frac{\pi^2 nEI}{L^2}=m\frac{dr^4}{L^2}\times 10^3$$

$$dr=\left(\frac{P\times L^2}{m}\times 10^{-3}\right)^{1/4}=\left(\frac{3903\times 1800^2}{9.8\times 10.2}\times 10^{-3}\right)^{1/4}$$

$= 19\ (mm)$

Screw shaft diameter at thread root area must be bigger than 19 *mm*.

◎So screw shaft diameter shall be ranged in between 25 and 50 *mm*.

• The length of screw shaft

L = Max. travel + Nut length + Unthreaded area length

= 1500 + 100 + 200 = 1800 (*mm*)

Slenderness ratio: 60 or less

$$D\geqq\frac{L}{60}=\frac{1800}{60}=30\ (mm)$$

◎ So screw shaft diameter shall be ranged in between 32 and 50 *mm*.

• Permissible rotational speed

Assume the supporting ends are fixed-supported

So the permissible rotational speed:

$$n = \alpha \times \frac{60\lambda^2}{2\pi L^2}\sqrt{\frac{EIg}{\gamma A}} = f\frac{dr}{L^2}\times 10^7$$

$$\Rightarrow dr \geqq \frac{n\times L^2}{f}\times 10^{-7} \quad (f=15.1,\ L=1800\ )$$

$$\geqq 30$$

If the highest rotational speed reaches 1500 *rpm*, screw shaft thread diameter at thread root area must be bigger than 30 *mm*.

◎So screw shaft diameter shall be ranged in between 36 and 50 *mm*.

• Calculating of basic dynamic rate load:

Motion	Axial load (N)	Mean rotation (rpm)	Time (sec)
Acceleration (down)	F_1=2958	n_1=750	t_1=1.0
Constant speed (down)	F_2=3395	n_2=1500	t_2=5.0
Deceleration (down)	F_3=3833	n_3=750	t_3=1.0
Acceleration (up)	F_4=3903	n_4=750	t_4=0.2
Constant speed (up)	F_5=3465	n_5=1500	t_5=5.8
Deceleration (up)	F_6=3028	n_6=750	t_6=0.2

Mean load

$$F_m = \left(\frac{F_1^3\cdot n_1\cdot t_1 + F_2^3\cdot n_2\cdot t_2 + \cdots\cdots + F_n^3\cdot n_n\cdot t_n}{n_1\cdot t_1 + n_2\cdot t_2 + \cdots\cdots + n_n\cdot t_n}\right)^{\frac{1}{3}} = 3436\ (N)$$

Mean rotation

$$N_m = \frac{n_1\cdot t_1 + n_2\cdot t_2 + \cdots\cdots + n_n\cdot t_n}{t} = 450\ (rpm)$$

As per design condition:

Life required is 20000 hours, Let $f_w=1.2$

$$L_t = \left(\frac{Ca}{F_m\times f_w}\right)^3 \times \frac{1}{60N_m}\times 10^6$$

$$Ca=(60N_m\times L_t)^{1/3}\times F_m\times f_w\times 10^{-2} = 33576\ (N) = 3426\ \ (kgf)$$

◎If the life required is > *20000* (*hours*),
Ca has to be > 3426 (kgf)

• Calculating basic static rate load:

$$Co = F_{max} \times f_S \qquad f_S = 2.0$$
$$= 7806\ (N)$$
$$= 800\ \ (kgf)$$

Co has to be > 800 (kgf)

◎Selection is made as follows:
Type of the Ballscrew: 40-10B2-FSWW
Screw shaft diameter: 40 (mm)
Lead:10 (mm)
Basic dynamic rate load: 3520 (kgf)

Selecting driving motor

<Required specifications>

The highest rotation speeds is 1500 *mm/min*

Time required to reach highest rotational speed is within 0.2 *sec.*

• Inertial

a. Screw shaft:

$$GD_S^2 = \frac{\pi\rho}{8} \times D^4 \times L = \frac{\pi \times 7.8 \times 10^{-3}}{8} \times 4^4 \times 180 = 141.1\ (kgf \cdot cm^2)$$

b. Moving parts:

$$GD_w^2 = W\left(\frac{l}{\pi}\right)^2 = (300+50) \times \left(\frac{1.0}{\pi}\right)^2 = 192.5\ (kgf \cdot cm^2)$$

c. Coupling:

$$GD_J^2 = 1.0\ (kgf \cdot cm^2)$$

d. Total of Inertial:

$$GD_L^2 = GD_S^2 + GD_w^2 + GD_J^2 = 334.6\ (kgf \cdot cm^2)$$

• Driving torque:

(1)Friction torque

a.Acceleration (downward):

$$T_1 = \frac{Fa \times l}{2\pi \times \eta} = \frac{2950 \times 1.0}{2\pi \times 0.9} = 520\ (N \cdot cm)$$

b.Constant speed (downward):

$$T_2 = \frac{Fa \times l}{2\pi \times \eta} = \frac{3395 \times 1.0}{2\pi \times 0.9} = 600\ (N \cdot cm)$$

c.Deceleration (downward):

$$T_3 = \frac{Fa \times l}{2\pi \times \eta} = \frac{3833 \times 1.0}{2\pi \times 0.9} = 680\ (N \cdot cm)$$

d.Acceleration (upward):

$T_4 = 690\ (N \cdot cm)$

e.Constant speed (upward):

$T_5 = 610\ (N \cdot cm)$

f.Deceleration (upward):

$T_6 = 540\ (N \cdot cm)$

(2)Preloading torque

$$T_P = k \times \frac{Fao \times l}{2\pi} \quad \therefore Fao = 0 \quad \because T_P = 0$$

(3)Torque required for acceleration:

$$T_7 = J \cdot w$$

$$= (J_L + J_M) \times \frac{2\pi n}{60 t_1} = \frac{(178 + 120)}{4 \times 980} \times \left(\frac{2\pi \times 1500}{60 \times 0.2} \right) = 59.7\ (kgf \cdot cm) = 585\ (N \cdot cm)$$

$GD_M = 120\ (kgf \cdot cm^2)$

(4)Total torque:

a.Acceleration (downward):

$T_{k1} = T_1+T_7 = 520+585 = 1105 \ (N{\cdot}cm)$

b.Constant speed (downward):

$T_{t1} = T_2 \quad = 600 \quad (N{\cdot}cm)$

c.Deceleration (downward):

$T_{g1} = T_3+T_7 = 680+585 = 1265 \ (N{\cdot}cm)$

d.Acceleration (upward):

$T_{k2} = T_4+T_7 = 690+585 = 1275 \ (N{\cdot}cm)$

e.Constant speed (upward):

$T_{t2} = T_5 \quad = 610 \quad (N{\cdot}cm)$

f.Deceleration (upward):

$T_{g2} = T_6+T_7 = 540+585 = 1125 \ (N{\cdot}cm)$

The maximum torque takes place at the time of acceleration.

$T_{max} = T_{k2} \quad = 1275 \ (N{\cdot}cm)$

• Selecting driving motor

<Selecting conditions>

a.The highest rotation speeds: $N_{max} \geqq 1500\ (rpm)$

b.Rated torque: $T_M = T_{rms}$

c.Rotor inertia: $J_M \geqq J_L/3$

The specifications required for driving motor are then decided as per above conditions

◎Motor specifications:

Output	$W_M = 2000\ (W)$
Highest rotation speeds	$N_{max} = 1500\ (rpm)$
Rated torque	$T_M = 13\ (N.m)$
Rotor inertia	$GD^2{}_M = 120\ (kgf.cm^2)$

• Effective torque:

$$T_{rms} = \sqrt{\frac{T_{k1}^2 \times t_1 + T_{t1}^2 \times t_2 + T_{g1}^2 \times t_3 + T_{k2}^2 \times t_4 + T_{t2}^2 \times t_5 + T_{g2}^2 \times t_6}{t}}$$

$$= \sqrt{\frac{1105^2 \times 1.0 + 600^2 \times 5 + 1265^2 \times 1 + 1275^2 \times 0.2 + 610^2 \times 5.8 + 1125^2 \times 0.2}{20}}$$

$$= 606\ (N \cdot cm) < 1300\ (N \cdot cm)$$

◎It conforms to design requirements.

Calculating the stress of the Ballscrew

$$\sigma = \frac{F}{A} = \frac{F_{max}}{\pi dr^2/4}$$

$$= \frac{3903\times9.8\times4}{\pi\times35.05^2}$$

$dr = 40+1.4-6.35=35.05(mm)$

(dr is screw shaft thread root diameter)

$$= 4.04\ N/mm^2$$

$$= 4.04\times10^6\ N/m^2$$

$$\tau = \frac{T\times r}{J}$$

$T_{max}=T_L=1275\ (N\cdot cm)=12750\ (N\cdot mm)$

$J=\frac{\pi dr^4}{32}=\frac{\pi(35.05^4)}{32}=148167\ (mm^4)$

$$= \frac{12750\times20}{148167}$$

$$= 1.72\ N/mm^2$$

$$= 1.72\times10^6\ N/m^2$$

$$\sigma_{max} = \sqrt{\sigma^2+\tau^2}$$

$$= 4.39\times10^6\ N/m^2$$

50CrMo4 steel tension strength is $1.1\times10^8\ N/m^2 > \sigma_{max}$

Yield strength is $0.9\times10^8\ N/m^2 > \sigma_{max}$

◎So the Ballscrew selected is safe.

Calculating the buckling load of the screw shaft

$$P = \alpha\frac{\pi^2 nEI}{L^2} = m\frac{dr^4}{L^2}\times10^3$$

$$= 10.2\times\frac{35.05^4}{1800^2}\times10^3$$

$$= 4751\ (kgf) > F_{max}\,(398\ kgf)$$

◎So the Ballscrew selected is safe.

PMI Ballscrew Cooling System

PMI's design of hollow cooling system is especially good for high speed Ballscrews. It shall well dissipate heat generated by friction between balls and grooves during Ballscrew running, and then to minimize thermal deformation as to ensure positioning accuracy.

Introduction to Hollow Cooling Screw Shaft

The hollow cooling system is designed by *PMI* (**Fig.38**) It uses a coolant pipe through the hollow hole of Ballscrew. The hollow hole is through all of the Ballscrew, and one end is clogged with the oil seal by *PMI* patent. The coolant is pumped into coolant pipe and flow to the end of coolant pipe. Coolant then flow reversely along the hollow hole back into the coolant collector. It can cool down the Ballscrew. The coolant is then sucked back to the cooling unit to drop coolant temperature and pumped again to the coolant pipe to complete circulation.

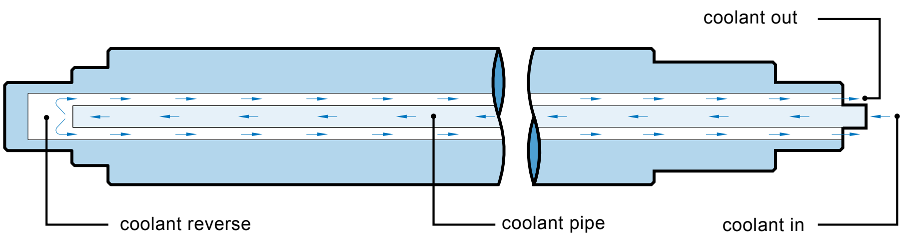

Fig.38 Hollow cooling diagram

Patent of Hollow Cooling Screw Shaft

Hollow cooling system

Features:

(1)Well and effectively control Ballscrew thermal expansion.

(2)Simple design and structure to save cost.

Fig.39 Hollow cooling system

Cooling entrance

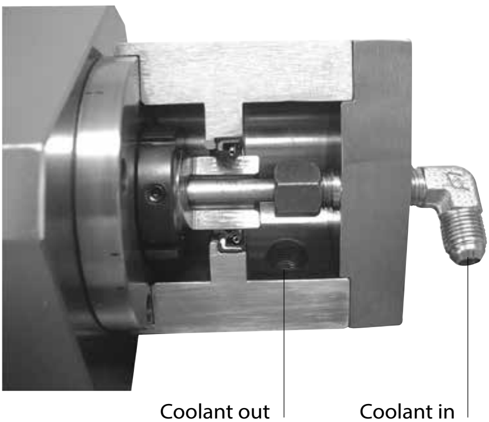

Fig.40 Cooling entrance

End sealing

Features:Easy for installing, disassembling and maintenance.

Coolant pipe support installation

Supported the coolant pipe. Let it don't touch Ballscrew.

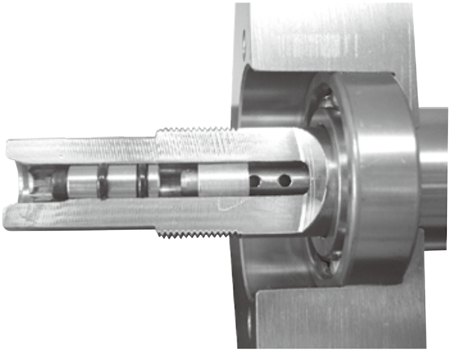

Fig.41 End sealing structure

Thermal control experiment

Test condition

Screw nominal O.D. :	Ø40 *mm*
Lead:	10 *mm*
Rotation speed:	1000 min^{-1}
Speed:	10 *m/min*
Load:	400 *kgf*
Slideways:	Box ways

The results of experiment

As per the results by experiment, *PMI*'s design of hollow cooling system proves an effective way for controlling the thermal expansion on the Ballscrew. Hence it is a very helpful design to high precision machine tools.

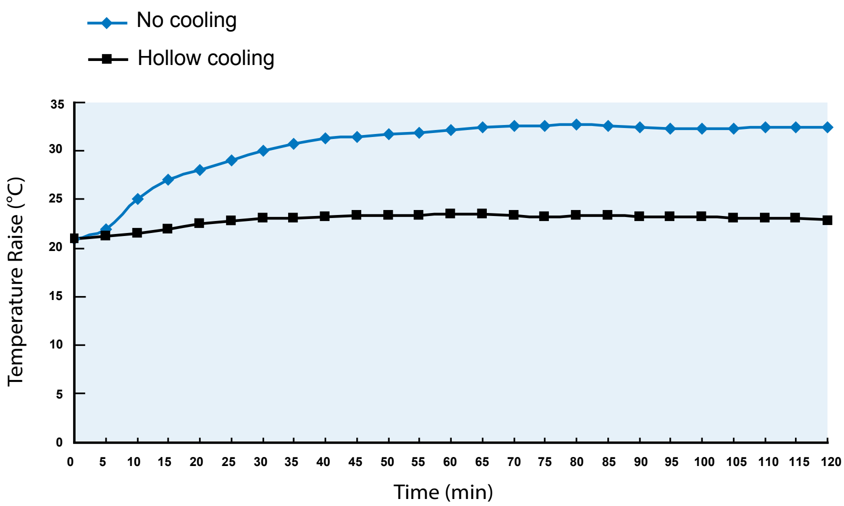

Fig.42 The results of experiment

Nut Cooling

The principle of design

Cool liquid is able to control the heat generation and thermal expansion by creating circulating cooling channel in the nut.

Type A - Recirculation Type Cooling

Coolant flow (L/min)	3.1
Coolant Temperature (°C)	Room temperature ±0.5

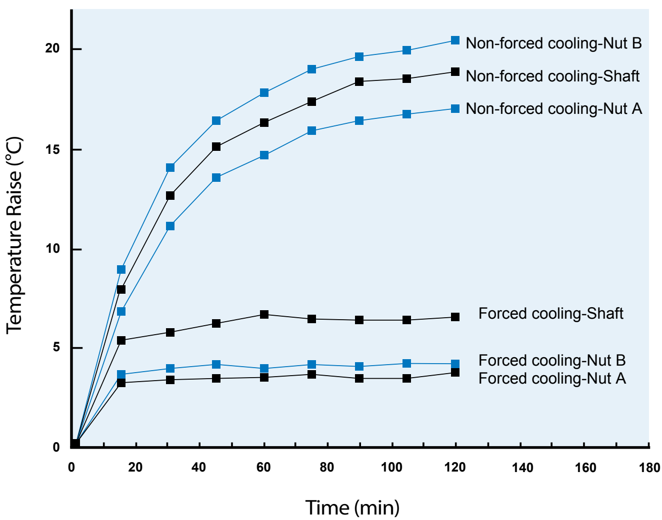

Fig.44 The results of experiment

Type B - Direct Passing Type Cooling

Cooling liquid at the same time enter the cooling channel of nut by direct passing, it's better cooling rate than recirculation channel type.

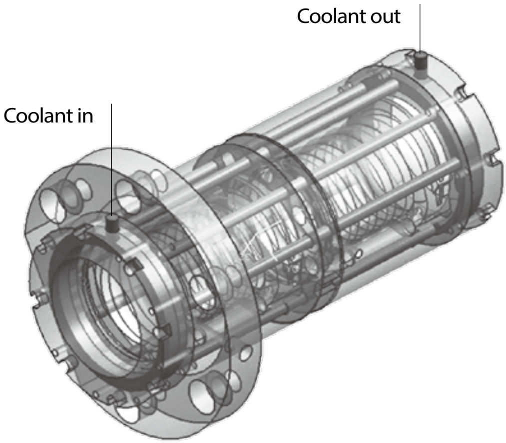

Fig.45 Direct passing type

Characteristics

Increase the positioning accuracy and the stability

Control the temperature rise of the ballscrew and reduced the heat deformation. The high velocity and accuracy of the machine will be reached.

Decrease the warm-up time of machine

The stable temperature of the ballscrew be quickly, so the warm-up time of the machine could be shortened.

Maintain capability of the lubrication oil

When the temperature of the ballscrew is stabilized, it is able to avoid the deterioration of the lubrication caused by high temperature.

Cooling Nut Applications

CNC Machine / Precision Machine / High Speed Machine / Medical equipment

Options

Ball screw of High Dustproof

The ballscrew which is applied to particular environment is easily affected by foreign matters like metal and wood dust intruding inside the screw and affecting the lifetime. In order to prevent from this, high dust-proof series accessories are designed. The special groove design of ballscrew can make the internal dust-proof and sealed washer of wiper fully attached the surface of whorl, and achieves the double effect of dust-free and dust-proof.

As the ballscrews comes with specially designed grooves, the highly dustproof seal washer inside the scraper perfectly matches the threads, a feature that ensures the removal of scraps as well as insulation dust.

Type A2 : Rubber Seal

Wiper specially developed for ball screws, with a multi-layered contact lips structure that ensures effective dust removal, the contact Gothic arch thread of bulgy shape and the lips interference outside diameter of screw shaft, so the dust can't entry inside of nut. As the ballscrews comes with specially designed grooves, the highly dustproof seal washer inside the scraper perfectly matches the threads, a feature that ensures the removal of scraps as well as insulation dust.

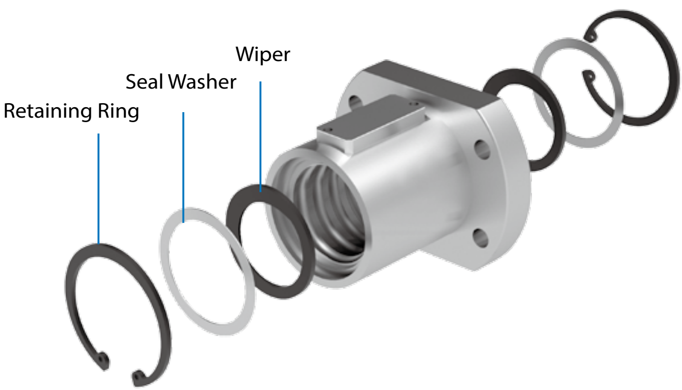

Fig.47Assembly of rubber seal

Table 23 High dustproof Test Conditions

Specifications	R40-10-FSVE
Running Stroke	300 *mm* (per cycle)
Motor Speed	150 *rpm*
Test Environment	Sawdust automatic circulation system
Minimal Size of Dust Particles	below 0.01*mm*

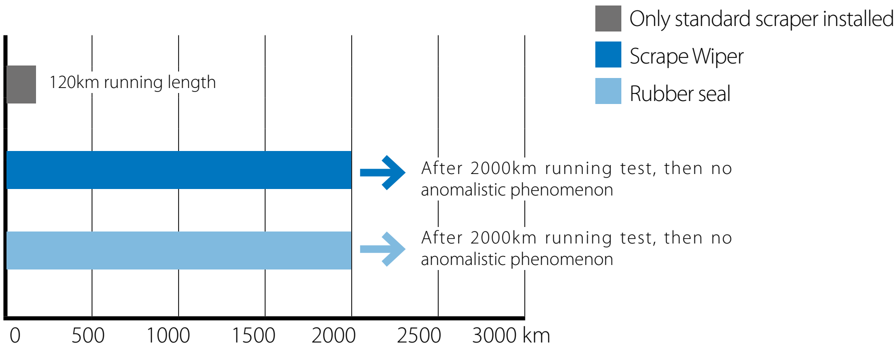

Fig.48 Dustproof performance Comparison

Type A3: Film Seal

The dustproof seals develop focus on general tool machine industrial that doesn't obviously increase of preload torque and temperature rise. Inhibit the grease leakage and scattering achieve cleaner operating environment. Provide the kind of seals that have better strength, service life and prevent fine dust or metal bit into the nut.

Heat generates and preload torque

The preload torque increase only 1~2 kgf-cm with film seals for ballscrew. Compare with non contact wiper, the suppression temperature rise at 1.5~2°C

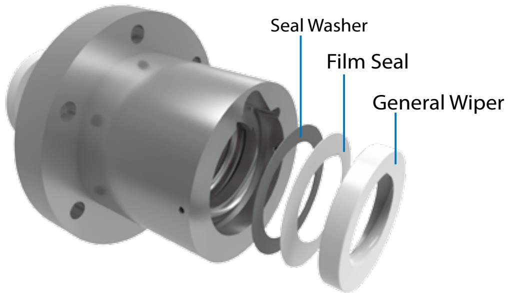

Fig.49 Assembly of a Film seal

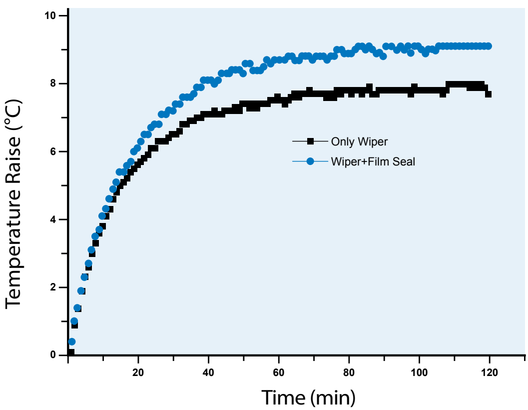

Fig.50 Heat generation comparison

B3 (Rolled grade + Film Seal)

Application of High Dustproof Ballscrew

Woodworking machine, laser processing machines, high accuracy transportation equipment, mechanical arms, and other machines that require a dustproof environment.

Spacer Ball Screw

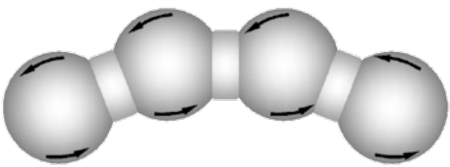
Structure and Features

The Ball Screw with the Spacer eliminates collision and friction between balls and increases the grease retention. This makes it possible to achieve a low noise、extends the lubrication maintenance interval and outstanding sliding.

Features

Low Noise, Soft Noise Tone and High Accuracy

With Spacer can avoid the interference sound among balls. And due to non-mutual friction thus increase heat generation, keep the accuracy in the range.

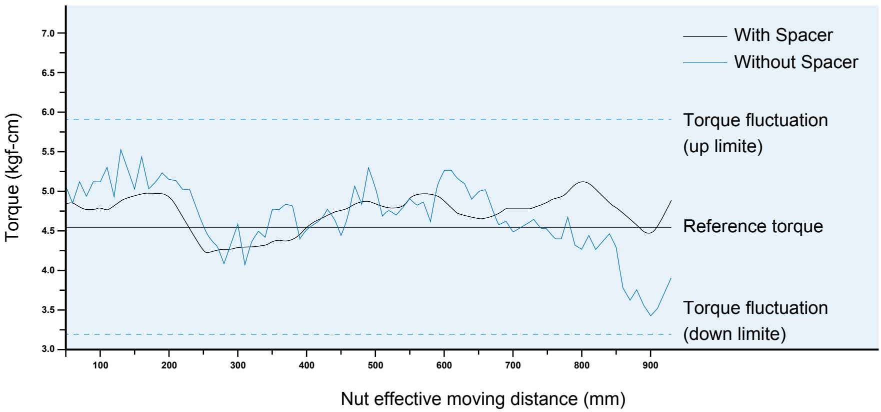


Extend the Maintenance Interval

The friction between the balls has been eliminated; the oil storage grooves design of Spacer and grease retention has been improved, the long-term maintenance-free operation is achieved.

Smooth Motion

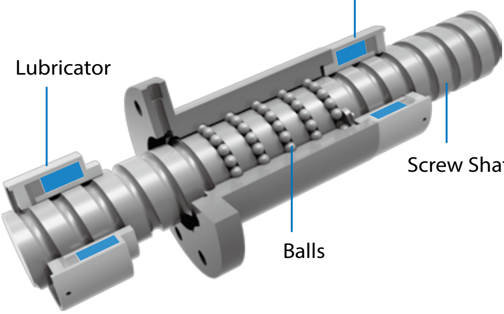
The use of a Spacer eliminates the friction between the balls, improves the torque feature, minimizes the torque fluctuation, and keeps constant speed during low-speed, thus high positioning accuracy to be achieved.

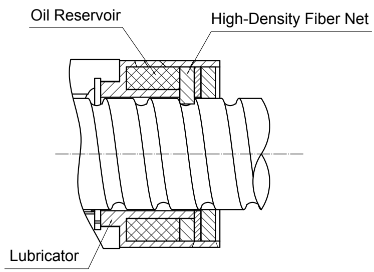


Self- Lubricant Unit- Q Lubricator

PMI lubricator unit is designed with an oil reservoir which equipped with a high-density fiber net. The lubricator feeds the right amount of lubricant to the raceway on the ballscrew. This allows an oil film to continuously be formed between the steel balls and the raceway, and drastically extends the lubrication and maintenance intervals.

Construction





Features

Contrary to the oil losing problem caused by ordinary lubrication, the Q lubricator effectively and evenly distributes adequate amount of oil onto ball raceway during the movement.

- Lengthening the maintenance intervals
- Environmentally Friendly
- Without the installation of other lubricating device, the cost of overall equipment cost is reduce.

Fits the Following Type of Nuts

Internal Ball Circulation Nuts, External Ball Circulation Nuts, End Deflector Series

PMI Precision Ground BallScrew

Internal Ball Circulation Nuts

Features

The advantage of internal ball circulation nut is that the outer diameter is smaller than that of external ball circulation nut. Hence it is suitable for the machine with limit space for Ballscrew installation.

It is strictly required that there is at least one end of screw shaft with complete threads **[A1-29]** Also the rest area next to this complete thread must be with smaller diameter than the nominal diameter of the screw shaft. Above are required for easy assembling the ballnut onto the screw shaft.

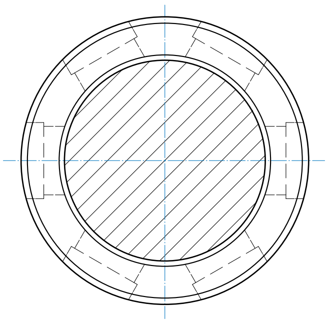


Fig.1 Internal ball circulation's side view

Features

It is important for a high-lead ballscrew to be with characteristics of high rigidity, low noise and thermal control.
PMI takes its patented design and treatments to achieve the following characteristics:

High DN Value

Max. DN Value: 220,000

Low Noise

The average and accurate ball circle diameter (BCD) through whole threads make the ballscrews to obtain the stable and consistent drag torque as well as to reduce the noise.
The audio frequency is low and downy due to the designed of plastic circulation system.

Space Saving

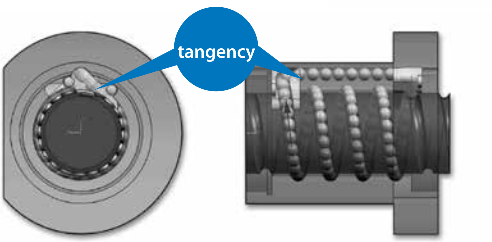
The ballnut diameter reduces 20%~25% substantially and the length of nut is shorter.
The total space shall be reduced to approximately 50% consequently.

Circulation

The specially designed pathway of the Recirculation System makes a contact with lead angle and also with BCD in the same tangency, improving its smoothness effectively.

Applications

CNC Machinery / Precision Machinery / High Speed Machinery /
Semi-Conductor Equipment / Medical equipment



Note: The ball diameter above(include) 7.983mm of End Deflector is made from metal.

External Ball Circulation Nuts

Features

- Lower noise due to longer ball circulation paths.
- Offers smoother ball circulation.
- Offers better solution and quality for high lead or large diameter ballscrews.

Type

There are two types of Ballnut of the external circulation Ballscrews. They are "immersion type" of **Fig.2** and "extrusive type" of **Fig.3** The "immersion type" means the ball circulation tubes are inside the circular surface of Ballnut as shown on specifications of this catalogue are of "immersion type".

In some cases, as per designs on customer's drawings, there are smaller outer diameters ballnuts required. Then the ball circulation tubes shall extrude out of Ballnut circular surface.

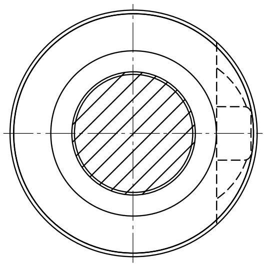

Fig.2 Immersion type

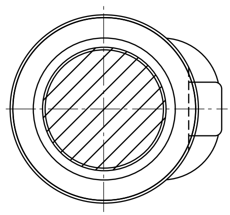

Fig.3 Extrusive type

High Lead Ballscrews

High-lead Ballscrews are essential elements and parts for high-speed machine tools of next century.

Features

It is important for a High-lead Ballscrew to be with characteristics of high rigidity, low noise and thermal control. *PMI*'s designs and treatments are taken for following:

High DN Value

The DN value can be 130,000 in normal case. For some special cases, for example in a fixed ends case, the DN value can be as high as 140,000. Please contact our engineers for this special application.

High Speed

PMI's High-speed Ballscrews provide 100 *m/min* and even higher traverse speed for machine tools for high performance cutting.

High Rigidity

Both the screw and ballnut are surface hardened to a specific hardness and case depth to maintain high rigidity and durability.

Multiple thread starts are available to make more steel balls loaded in the ballnut for higher rigidity and durability.

Low Noise

Special design of ball circulation tubes offer smooth ball circulation inside the ballnut. It also makes safe ball fast running into the tubes without damaging the tubes.

Accurate ball circle diameter (BCD) through whole threads for consistent drag torque and low noise.

Ballscrews For Heavy Load

Features

Focused on improvements of contact points of balls and thread grooves, ball diameter and circulation system for new type, FSVH. The rated dynamic load has been increased to as two times as that of conventional type, FSVC.

Long Life

Structure of the newly developed circulation system is designed to distribute the load uniformly to the load balls and it also increases the life of ballscrews.

On conventional circulation system, FSVC, the returning tube is inserted into the holes on ballnut perpendicularly which forms an advancing angle. While ball moves into returning tube, it will hit tube end area and then move into returning tube.

New circulation system, FSVH, ball will move into returning tube smoothly by tangent line as the same direction as lead angle. It can increase the life of circulation system structure.

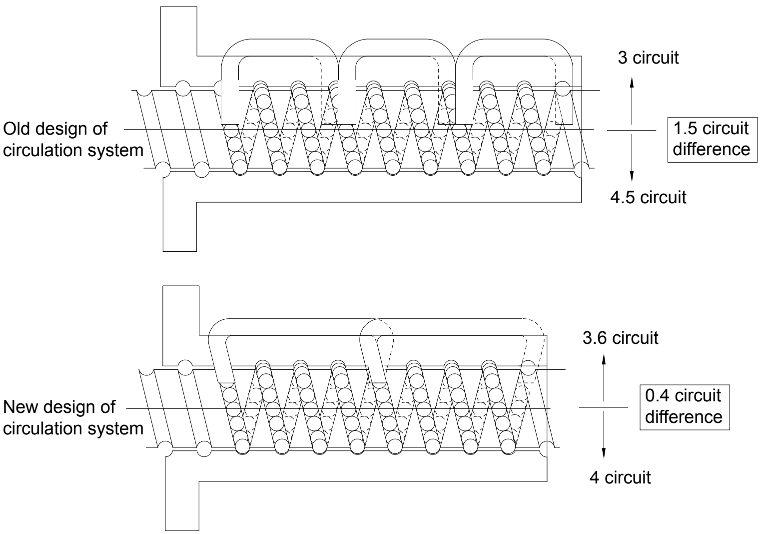

Fig.4 Circuit difference for heavy load ballscrew

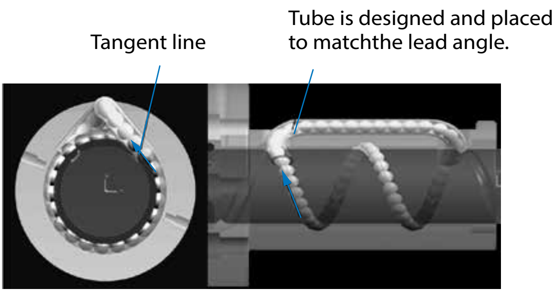
High DN Value

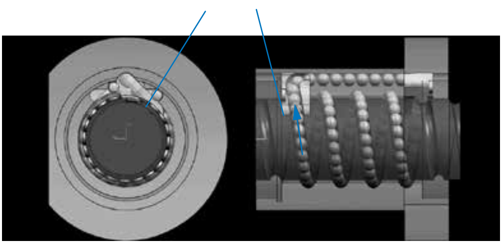
With the newly developed circulation system, ballscrews can meet the demands of high speed running with high DN value.

Low Noise

To use tangential circulation system structure, it can eliminate the noise while balls run into the returning tube.

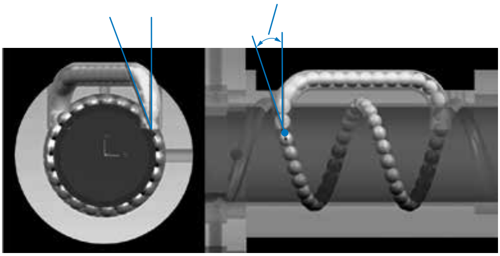


FSVH circulation system structure(NEW)



FSDH circulation system structure (NEW)

Fig.5 Circulation system structure for FSVH and FSDH



FSVC circulation system structure

Fig.6 Circulation systwm structure for FSVC

Various Specifications Combination

PMI can supply various ballscrews with diameter 40~120*mm* and lead 10*mm* to 60*mm* (Please contact ***PMI*** for your specific design requirement)

Recommend mounting direction of heavy load ball screws

In order to support equal load distribution for shaft and nut, recommend mounting direction of ball screws allow **fig.7[A1-182]** This mounting direction can avoided vibration as axial load uneven distribution for ball screws, therefore increase service life efficient.

Accuracy Grade and Axial Play

If you have any question about accuracy grade and axial play(e.g. axial play <0), please contact our sales for your specific design requirement.

Unit: *mm*

Grade \ Axial play	S	N
	0.010 or less	0.030 or less

PMI Rolled Ballscrews

Introduction to Rolled Ballscrews

The production of the *PMI* rolled ballscrews has adopted a manufacturing process and equipment unlike other manufacturers. Combining advanced skills and the Bad Düben digital electric screw thread rolling machine, we adhere to a strict quality control policy at every stage of production, from the selection of ballscrew material and rolled processing to induction hardening heat treatment and post production. We are committed to providing clients with products of the best quality.

The combination of rolled ballscrews and ground nuts has replaced the traditional ACME screws and trapezoidal screws. This makes for a smoother operation while lowering friction and backlash. Moreover, the new technology has the advantage of faster production speed and lower prices.

We employ the most advanced digital electric screw thread rolling machine. During the manufacturing process, the oil cylinders on the two axes of the thread rolling dies employ a servo hydraulic system for the correction of oil pressure and positioning precision.

We employ Germany-imported Bad Düben roller in order to maintain the stability of the thread rolling machine and the quality of the rolled product.

Features of the *PMI* Rolled Ballscrew

High Precision Rolled Nuts

The manufacturing process of rolled nuts is identical to that of ground nuts. Surface hardening treatment and internal thread grinding ensure durability and smoothness.

Nuts are Interchangeable

Without preload and within the maximum permissible axial play, different types of nuts can be used on the same screw.

Lead Accuracy of Rolled Screws (e_{300})

According to ISO 3408-3, the definition of lead accuracy for ***PMI*** rolled ballscrews is as follows: Within the effective thread length, the permissible value of accumulated lead deviation in random 300*mm*. As shown in **Table 1**:

Table 1 Lead Accuracy

e_{300} (Within the effective thread length, the permissible value of accumulated lead deviation in random 300mm)

Unit: μm

Grade	C5	C7	C8	C10
ISO, DIN	23	52	-	210
JIS	18	50	-	210
PMI	23	50	100	210

e_p (Within the effective thread length, the permissible value of accumulated lead deviation)

Unit: μm

Grade	C5	C7	C8	C10
PMI	$e_p=\pm(lu/300)\times e_{300}$ lu: Effective thread length (Unit: *mm*)			

Unit: μm

e_{300} Grade / Measured length	C5	C7	C8	C10
0~100	20	44	84	178
101~200	22	48	92	194
201~315	25	50	100	210

Reference Table of the Nominal Outer Diameter and Lead of the *PMI*'s Rolled Screw Shaft

PMI rolled ballscrews offer a variety of specifications, lead accuracies, and maximum rolling length, as shown in **Table 2~3**:

Table 2 Specifications of Rolled Ballscrews

Screw nominal outer diameter Ø	Lead															Maximum rolled ballscrew length

Axial Play

The maximum axial play under normal non-preload condition, as shown in **Table 4**

Table 4 Maximum Axial Play

Ball Diameter Ød (*mm*)	0.8~1.2	1.588~2.381	2.778~4.762	6.35~7.938
Maximum Axial Play (*mm*)	<0.01	<0.02	<0.04	<0.07

Materials and Hardness

Standard material and surface hardness for ***PMI*** rolled screw, as shown in **Table 5**

Table 5

Denomination	Material	Heat Treatment	Hardness (HRC)
Rolled screw	S55C/Equivalent	Induction hardening	58~62
Nuts	SCM420H/Equivalent	Carburized hardening	58~62

Types and Dimensions of Rolled Screw Shaft

Automation Industry Specialized Type

Product Features

High Applicability Shaft Ends

Without heat treating processes on the shaft ends, the center holes on both side will be reserve. The shaft ends could be easily manufactured to favored size.

Short Delivery

Standardized stock for general specification's thread length and length of blank shaft ends.

Lower Price

The accuracy can be as good as JIS C5 and C7 grade and with standardized axial clearance for the reason that can be cost down and the price will be cheaper.

Nomenclature

PTR 20 10 T3 C7 S -1500

- -1500: Overall length
- S: Axial play
- C7: Grade

PPR(Miniature Series) - Features

Space Saving

External circulation system, it don't need to have at least one end with complete thread to the end of Ballscrew for Ballnut assembly to screw shaft. And the special design of ballnut, so the size of ballnut is same as internal circulation system of ballnut, Space saving.

Circulation

By way of 3D Spline designed pathway for circulation system, and has enhanced the smooth circulation of ball ,that can reduce the wearing and increase the life of ballscrew.

PTR(End Deflector Series) - Features

Space Saving

The ballnut diameter reduces 20%~25% substantially and the length of nut is shorter.

Low Noise

The average and accurate ball circle diameter (BCD) through whole threads make the ballscrews to obtain the stable and consistent drag torque as well as to reduce the noise.
The audio frequency is low and deep due to the designed of plastic circulation system.

Service Problems Analysis of Ball Screws

Preface

In recent years, more and more ballscrews are installed in various machines to meet the requirements of higher accuracy and better performance.

Ballscrews become one of the most widely used power transmission components. In CNC machines, ballscrews help improve their positioning accuracy and elongate their service life. Ballscrews are also increasingly used to replace ACME screws in manually operated machines.

A ballscrew is normally preloaded to minimize the backlash of machine movement. Even a high precision ballscrew will not provide good accuracy and long service life if it is not installed properly.

This article discusses primary ballscrew problems and their precautions. Some measuring procedures are also discussed to help users locate the cause of an abnormal backlash.

The Cause and Precautions of Ballscrew Problems

Three major categories of ballscrew problems and their precautions are discussed as follows

Unsmooth operation

Defects from ballscrew manufacturing

- The return tube is not attached to the ball nut appropriately.
- The track surface of the ballscrew spindle or the ball nut is too rough.
- The roundness of the ball nut or the screw shaft is out of tolerance.
- The lead or the pitch circle diameter of the ball nut / the shaft is out of tolerance.

Over-travel

Over-travel can damage the return tube and cause it to collapse or even break. When this happens, the steel balls will not circulate smoothly. They may break and damage the groove on the ball nut or the screw shaft under severe circumstances. Over-travel may happen during set-up or as the result of a limit switch failure or a machine collision. To prevent further damage, an over-traveled ballscrew should be checked or repaired by the manufacturer before it goes back to service.

Misalignment

Radial load exists if the center line of the ball nut's housing and the screw shaft's bearing support bracket are not aligned properly. The ballscrew unit may bend if this misalignment is too big. An abnormal wear may still happen even if the misalignment is not significant enough to cause a noticeable bending. The accuracy of a ballscrew unit will deteriorate rapidly if it is misaligned. The higher the preload is set in the nut, the more demanding the alignment accuracy is required in the ballscrew.

Foreign objects enter the ball path

Machined chips get in the ball track. The chips or dust generated during machining processes may be trapped in the ball track if wiper kits are not used to keep them away from the surface of the ballscrew unit. This may cause unsmooth operation, deteriorate accuracy and reduce service life.

Damaged return tube

The return tube may collapse and cause the same problems as mentioned above if it is hit heavily during installation.

The ball nut is not mounted properly on the nut housing

Eccentric load exists when the mounted ball nut is tilted or misaligned. If this is the case, the motor current may fluctuate during rotation.

Ballscrew unit is damaged during transportation

- During installation, avoid nuts separating away from screw, otherwise the balls will getting out of the nut, that lead to change of the preload and damage of the circulation system and wiper.
- Due to the low friction coefficient, nuts will fall down because of its self weight during vertical deposition; this kind of damage should be avoided, once happened,it should be inspected by manufacturer preventing further damage.

Too much plays

No preload or insufficient preload

The ball nut will rotate and move downward by its self weight when a non-preloaded ballscrew is held vertically with the screw shaft constrained. A significant backlash may exist in a non-preloaded ballscrew unit. Therefore non-preload ballscrews are only used in the machinery, where operation resistance but not positioning accuracy low is the major concerned.

PMI can determine the correct amount of preload based on different applications. We can also preset the amount of preload before shipment. Be sure to clearly specify the operation condition of your application when you order a ballscrew unit.

Inappropriate bearing selection and installation

- Angular ball bearings should be used in ballscrew installation. A ball bearing with high pressure angle specially designed for ballscrew installation is even a better choice. A regular deep groove ball bearing will generate a significant amount of axial play when axially loaded. It should not be used in this application.

- Two lock nuts and a spring washer should be used in the bearing installation to prevent them from getting loose in operation.
- The perpendicularity between the bearing seating face and the thread axis of the bearing locknut on the ballscrew, or the parallelism between the opposite faces of the locknut is out of tolerance causing the bearing to tilt. The thread for bearing lock nut and the seating face of a bearing in the ballscrew journal should be machined in one setting to ensure the perpendicularity. It is even better if they can be ground.
- If the bearing is not attached to the screw shaft properly, it would cause axial play under load. This problem may be caused by the bearing journal of the screw shaft being too long or the non-threaded part of the screw shaft being too short. To solve this problem used the collar.

Parallelism or flatness of the housing surface is out of tolerance

In a machine assembly, a shim bar is frequently located between the housing location surface and the machine body for adjustment purpose. The clearance of table movement may vary at different locations if the parallelism or flatness of any matching component is out of tolerance no matter they are ground or scraped.

The ball nut housing or the bearing housing is not rigid enough

The ball-nut-mounted housing or the bearing-mounted housing may deflect under components' weight or machining load if it is not rigid enough.

The ball nut housing or the bearing housing is not mounted properly

- Ball-nut-seated screws become loose due to vibration and lack of a spring washer.
- Ball-nut-seated screws are not seated firmly because the screws are too long or the thread holes on housing are too short.
- Components may become loose due to vibration or lack of locating pin(s). Solid pins instead of spring pins should be used for locating purpose.
- Not enough locking forces for fixing screw because of too short screws

The motor and the ballscrew spindle are not assembled properly

- There will be a relative rotation between the motor shaft and the ballscrew spindle if the connecting coupling is not installed firmly or the coupling itself is not rigid enough.

- Key is loose in the groove. Any inappropriate match among the hub, key, and key seat may cause these components to generate backlash.
- Driving gears are not engaged properly or driving mechanism is not rigid. A timing belt should be used to prevent slipping if the ballscrew is to be driven by a belt.

Fracture

Broken bearing ball

Cr-Mo steel is the most commonly used material for bearing balls. It takes about 1,400kg (3,080lb) to 1,600kg (3,520lb) to break a steel ball of 3.175 mm (1/8 in) diameter. The temperature of an under-lubricated or non-lubricated ballscrew raises substantially during operation. This temperature raise could make the bearing balls brittle or break which cause damage to the grooves of the ball nut or the ballscrew spindle consequently.

Therefore, lubricant replenishment should be considered during the design process. If an automatic lubricating system is not available, periodical grease replenishment should be scheduled as part of maintenance program

Collapsed or broken return tube

Over-travel of the ball nut or an impact on the return tube could cause the return tube to collapse or break. This may block the path of bearing balls and cause them to slide instead of rolling and break eventually.

Ballscrew shaft end breaks

- Inappropriate design: Sharp corners on the ballscrew spindle should be avoided to reduce local stress concentration.
- Bend of screw shaft journal: The seating surface of the bearing of the ballscrew and the thread axis of the bearing's lock nut are not perpendicular to each other or the opposite sides of the lock nut are not parallel to each other. This will cause the end of screw shaft to bend and eventually break. The amount of deflection at the end of the ballscrew shaft before and after the bearing's lock nut being tightened should not exceed 0.01 mm (0.0004 in).
- Radial force or fluctuating stress: Misalignment in the ballscrew installation creates abnormal fluctuating shear stress and causes the ballscrew to fail prematurely.
- It should be avoided, that the dimension of ball screw shaft end too much different designed from ball screw shaft section area.

Influence of temperature raise on ball screw

During the operation of ball screws, the accuracy of machine drive system will influenced by the raise of the temperature, aspecially for the high speed and high accuracy machines.Following factors affect the temperature raise of ball screws.

- The Influence of Preload

  Increase the rigidity of ball screw nut in order to avoid the lost motion of the machine drive system, that means increase the preload of the nut to a certain standard. Once the nut being preloaded, the friction torque will be increase, making the temperature raised during operation. ***PMI*** recommened, that the preload force should be 1/3 of the maximal axial load and is not bigger then 10% of the dynamic load, in order to obtain the optimal life time and lower temperature raise effect.

- The Influence of Pretension

  The elongation and deformation of ball screws because of heat will deteriorate the position accuracy. The amount of thermal elongation can be calculated by certain formula and cpmpensated by preloading torque. The target value of the Pretension compensation is the negativ T value on the diagram. Too much Pretension will burn the support bearing. Therefor ***PMI*** recommened, that the pretention should smaller then the Pretension by 5°C; however when the ball screws diameter is over 50mm, it is not suitable for a preloading torque, that means large Pretension forces will be needed when the diameter is large and will burn down the support bearing. ***PMI*** recommened, that 2~5°C of temperature raise should be used as standard to compensate the value T (about -0.02~-0.06mm every 1000mm of ball screw)

- The Influence of Lubrication

  The choice of the lubrication will directly effect the temperature raise of the ball screws. The ball screws of ***PMI*** should be lubricated by oil or grease. Normaly lubrication oil for bearings will be recommended as ball screw lubrication, and grease from lithium soap will be recommended as lurbrication grease. The choice of viscosity of the lubrication should be according to the operation speed, the working temperature, and the situation of load.

  Low viscosity lubrication should be choosed during high speed and low load situation; high viscosity lubrication during low speed and high load situation. Normally, viscosity range of lubrication will be recommended at 32~68cSt (ISO VG 32~68)(DIN51519) during 40°C, high speed; viscosity range of lubrication will be recommended over 90cSt(ISO VG 90) during 40°C, low speed. By application of high speed and heavy load, force cooling must be used in order to reduce the temperature, and using hollow ball screw or cooling oil though nut to meet the cooling consequent.
